## BOUNDS ON COMPLEMENTARY 3-DOMINATION NUMBER IN GRAPHS

V.G. Bhagavathi Ammal ${ }^{1 *}$, M.K. Anushya ${ }^{2}$

#### Abstract

In Graph theory, a dominating set for a graph $G$ is a subset S of its vertices such that every vertex in $V-S$ is adjacent to atleast one vertex in $S$. The minimum cardinality of a dominating set is called the domination number and is denoted by $(G)$. A dominating set $S$ of a graph $G$ is said to be a complementary 3dominating set of G if for every vertex in $S$ has atleast three neighbors in $V-S$. The minimum cardinality of a complementary 3-dominating set is the complementary 3-domination number $\gamma_{3}^{\prime}$ of a graph $G$. In this paper we determine complementary 3 -domination number for some standard graphs and obtain some results concerning this parameter.

## 1. Introduction:

By a graph we mean a simple, connected, finite and undirected graph $\mathrm{G}=(\mathrm{V}, \mathrm{E})$ where V is the vertex set whose elements are vertices or nodes and $E$ is the edge set. Unless otherwise stated the graph $G$ with $|V|=n$ and $|E|=q$. Degree of a vertex $v$ is denoted by $(v)$. Let $\Delta(G)$ and $\delta(G)$ denotes the maximum and minimum degree of a graph respectively. We denote a complete graph on $n$ vertices by $K_{n}$. A bipartite graph $\mathrm{G}=(V, E)$ with partition $V=\left(V_{1}, V_{2}\right)$ is said to be a complete bipartite graph if every vertex in $V_{1}$ connected to every vertex of $V_{2}$. A gear graph $G$, is a wheel graph with a graph vertex added between each pair of adjacent graph vertices of the outer cycle. A Fan graph $F_{\underline{m}}$, is defined as the graph join $\bar{K}_{m}+P_{n}$, where $\bar{K}_{m}$ is the empty graph on $m$ nodes and $P_{n}$ is the path graph on $n$ nodes. The $\boldsymbol{n}$ - Barbell graph is the simple graph obtained by connecting two copies of a complete graph $K_{n}$ by a bridge. A graph $G$ is connected if any two vertices of $G$ are connected by a path. The complement $G$ of $G$ is the graph with vertex set V in which two vertices are connected if and only if they are not adjacent in G. A star graph $\boldsymbol{K}_{1, \boldsymbol{n}}$ is a tree on $n$ vertices with one vertex having vertex degree $n-1$ and the other $n-1$ having vertex degree one. The friendship graph $\boldsymbol{F}_{\boldsymbol{n}}$ can be constructed by joining ${ }^{\prime} n$ copies of the cycle graph $C_{3}$ with a common vertex which becomes a universal vertex for the graph. A wheel graph $\boldsymbol{W}_{\boldsymbol{n}}$ is a graph formed by connecting a single universal vertex to all vertices of a cycle. A graph $C(1)$ is obtained by attaching a path $P_{2}$ to any vertex of degree $C_{m}$. $C_{m}+e$ is a graph obtained by adding an edge into a cycle $C_{m} . C\left(P_{n}\right)$ is a graph obtained by attaching a path $P_{n}$ to any vertex of $C_{m}$. A Nordhaus Gaddum type result is a lower and upper bound on the sum or product of a parameter of a graph and its complement. A subset $S$ of $V$ is called a dominating set of $G$ if every vertex In V-S is adjacent to atleast one vertex in $S$. The domination number $(G)$ is the minimum cardinality of a dominating set. In this paper we introduce the concept of complementary 3-domination number and we present some basic theorems related to this parameter.

Definition:1.1 A dominating set $S$ in a graph $G$ is said to be a complementary 3-dominating set of G if any vertex in $S$ has atleast three neighbours in V-S. The complentary 3-domination number $\gamma_{3}^{\prime}(G)$ of a graph $G$ is the minimum cardinality of a complementary 3-dominating set.

## Example: 1.2

Fig: 1
For the above example the dominating set is $\left\{v_{1}, v_{7}\right\}$ and the complementary 3-dominating set is $\left\{v_{1}, v_{2}, v_{3}\right\}$ and hence $\gamma_{3}^{\prime}(G)=3$

## 2. $\boldsymbol{\gamma}_{3}^{\prime}$ number for some standard graphs

${\underset{\gamma}{3}}_{\prime}^{\prime}\left(K_{n}\right)=1$
$\underset{m}{2} \underset{\sim}{\geq} \underset{2}{\text { For }}, n \geq 3$ any complete bipartite graph $\gamma_{3} K_{m, n}\left(K_{m, n}\right)=$
2 if $m=2, n=3$ and $m \geq 4, n \geq 4$
$\{3$ if $m=n=3$ and $m=3, m=4$
3. For any wheel graph of order $n \geq 4, \gamma^{\prime}\left(W_{n}\right)=$ 1
4. For any Friendship graph $F_{n}, \gamma_{3}^{\prime}(G)=1$ where $n \geq 5$
5. For any prism graph $C L_{p}$ of order $p \geq$ $6, \gamma_{3}^{\prime}\left(C L_{p}\right)=\left\{\begin{array}{l}-1 \text { when } n \text { is odd } \\ n-2 \text { when } n \text { is even }\end{array}\right.$
where $p=2 n, n \geq 3$
6 . For any gear graph of order $p \geq 7, \gamma_{3}^{\prime}\left(G_{p}\right)=n$ where $p=2 n+1, n \geq 3$
7. For any star graph $K_{1, n}$ of order $n \geq$
$3, \gamma_{3}^{\prime}\left(K_{1}\right)=1$
8. For a Petersen graph G, $\gamma_{3}(G)=3$

Observation:2.1 Illustrative example for which domination number equals the complementary 3dominaion number.

Fig: 2
Graph for which $\gamma_{3}^{\prime}(G)=(G)$
For the figure: $2, S=\left\{v_{3} v_{7}\right\}$ forms $\gamma_{3}^{\prime}-$ set and hence $\gamma_{3}^{\prime}(G)=\gamma(G)=3$

Observation: 2.2 The complement of a complementary 3-dominating set need not be a complementary 3 -dominating set.

Fig: 3
Example for which complement of $\gamma_{3}^{\prime}-$ set need not be a $\gamma_{3}^{\prime}-$ set. In figure: $3^{\prime}$ the set. $S=\left\{v_{4}, v_{6}\right\}$ forms a $\gamma_{3}^{\prime}-$ set and hence $\gamma_{3}^{\prime}(G)=2$ but not a complementary 3 dominating set.

Observation: 2.3 Every complementary 3dominating set is a dominating set but the converse need not be true.
Consider $C_{4}+e$. Let $\left\{v_{1}, v_{2}, v_{3}, v_{4}\right\}$ be the vertices of $C_{4}+e$. Now the set $S=\left\{v_{2}\right\}$ is the complementary 3-dominating set and dominating set.
Consider $C_{5}$. Let $\left\{v_{1}, v_{2}, v_{3}, v_{4}, v_{5}\right\}$ be the vertices of $C_{5}$. Now thw set $S=\left\{v_{3}, v_{5}\right\}$ for the dominating set but not $\gamma_{3}^{\prime}-$ set.

Observation: 2.4 Let Ge a connected graph and h be a spanning subgraph of G. H has $\gamma_{3}^{\prime}-$ set then $\gamma_{3}^{\prime}(G) \leq \gamma_{3}^{\prime}(H)$ and the bound is sharp.

In the above figure, Let the set $S=\left\{v_{1}\right\}$ forms $\gamma_{3}$ - set and hence $\gamma_{3}^{\prime}(G)=1$. Let $H_{1}$ and $H_{2}$ be the spanning subgraphs of $C_{6}$
forms $\gamma_{3}$ Now $S_{1}=\left\{v_{1} v_{5}\right\}$
$v_{2}=$ forms $\gamma_{3}^{\prime}$ set and hence $\gamma_{3}\left(H_{1}\right)=2$. Let $S_{2}=$ $\left\{\begin{array}{l}\left.v_{1}, v_{2}, v_{3}, v_{4}, v_{5}, v_{6} v_{7}\right\} \\ \text { hence } \gamma_{3}\left(H_{2}\right)\end{array}=\begin{array}{l}\text { forms }\end{array} \gamma_{3}^{\prime}-\right.$ set and Remark: $2.5 \quad$ For $\quad C_{4}+e \quad$ with vertices $\left\{, v, v, v^{v}\right\}$ with $e \in v{ }^{v} q^{2}\{v\}$ forms $\gamma_{3}-\operatorname{set}^{\prime \prime}$ and hence $\gamma_{3}(G)=1$. Let ${ }^{3} H \cong{ }^{1} C_{4}$ be a $\stackrel{\text { spanning }}{\gamma_{3}(H)} 4$ subgraph of of $C_{4}+e e^{\prime}$ which implies the spanning subgraph of $C_{n}$ which implies

Observation: 2.6 For any connected graph G, $\gamma(G) \leq \gamma_{c}(G) \leq \gamma_{3}^{\prime}(G)$

Fig:5 Graph for which $\gamma(G) \leq \gamma_{c}(G) \leq \gamma_{3}^{\prime}(G)$

In the above figure, $\left\{v_{1}, v_{5}\right\}$ forms a dominating set $\left\{v_{1}, v_{3}, v_{4}\right\}$ forms a connected dominating set and $\left\{v_{1}, v_{2}, v_{3}, v_{4}, v_{5}, v_{6}\right\}$ forms a cpmplementary
3-dominating set and hence

$$
\gamma_{3}^{\prime}(G) \leq \gamma_{3}^{\prime}(H)
$$

Theorem:2.7 If $G$ is any connected graph then $1 \leq \gamma^{\prime}(G) \leq n$
Proof: If G is any non-trivial connected graph containing degree $\Delta(G)=n-1$ or graphs with diam $=r a d=1$, then $\gamma_{3}^{\prime}(G)=1$, the lower bounds holds. Let $\Delta\left(G \gamma^{\prime} \Varangle \sigma_{3}\right)-4 \cdot \gamma \mathrm{~F}\left(0 P_{3^{2}}\right) \mathrm{g}=\mathrm{ranph}$ not having two or more vertices of degree two continuously then $1<\gamma_{3}^{1}(G)<n$. Let $S$ be the dominating set of $G$. For some vertex $u \in S$, $(u)=1$ or 2 then S is not a complementary

Theorem: 2.8 For any connected graph $G$ of order $n \geq 4$, every $\gamma_{3}^{\prime}(G)-$ dominating set of $G$ contains its support vertices.
Proof: Let $G$ be a connected graph of order $n \geq 4$ and $S$ be a $\gamma_{3}^{\prime}-$ dominating set of $G$. Let $u$ be a support vertex of $G$. Then there exists a pendant vertex $v$ which is adjacent to $u$ in $G$. Suppose $u$ does not belongs to S . Then $v$ is not dominated by any vertex in S implies $v \in S$. But
$\operatorname{deg}(v)=1$ shows that $S$ is not a $\gamma^{\prime}{ }_{3}-$ dominating set of G , which is a contradiction. Hence, $u \in S$.

Theorem: 2.9 If $G$ is a graph without isolated vertices $d e(G) \geq 3$ and S is a minimal
Proof: Let G be a graph without isolated vertices with $\Delta(G) \geq 3$ and $S$ be a minimal
To prove: $u$ is dominated by some vertex in $V(G)-S$
Suppose is not dominated by any vertex in $V(G)-S$. Since G has no isolated vertices and S is a $\gamma_{3}^{\prime}-$ dominating set of $G$, each vertex in (G) $-S$ has atleast three neighbours in $S-\{u\}$. This contradicts the fact that $S$ is a minimal dominating set of G.
Note: 2.10 If $G$ is connected graph with $d e(G) \geq 3$ and S is a $\gamma_{3}^{\prime}-$ dominating set of G then the complement $V-S$ need not be a $\gamma_{3}^{\prime}-$ dominating set.

Theorem: 2.11 For any connected cubic graph of order $8 \gamma_{3}^{\prime}(G)=\chi(G)=3$ if and only if $G \cong$ $G_{1}$ or $G_{2}$.

Proof: If $G \cong G_{1}$ or $G_{2}$ then obviously $\gamma_{3}^{\prime}(G)=$ $(G)=3$. Conversely let us assume that $\gamma^{\prime}(G G)=$
$(G)=3$. Let us assume that $S=\{x, y, z\}$ be a minimum complementary 3 -dominating set of $G$ and $V-S=\left\{u_{1}, u_{2}, u_{3}, u_{4}, u_{5}\right\}$. Clearly $\langle S\rangle$ is not equal to $K_{3}$. Therefore we consider three cases.

Case: (1) $\langle\mathrm{S}\rangle=K_{3}^{-}$
With no loss of generality, let $(x)=$ $\left\{u_{1}, u_{2}, u_{3}\right\}$. Then atleast one of the vertices of $(x)=\left\{u_{1}, u_{2}, u_{3}\right\}$ is adjacent to $y$.

Subcase:(i) One vertex of $N(x)$ adjacent to $y$, say $u_{1}$.
For this case $u_{4}$ and $u_{5}$ are adjacent to $y$. Suppose now $z$ is adjacent or non adjacent to $u_{1}$.
Suppose if $z$ is adjacent to $u_{1}$ then $z$ is adjacent to $u_{2}$ and $u_{3}$ ( or equivalently $u_{4}$ and $u_{5}$ ) or $u_{2}$ (or equivalently $u_{3}$ ) and $u_{4}$ (or equivalently $u_{5}$ ). If $z$ is adjacent to $u_{2}$ and $u_{3}$, then $u_{2}$ is non adjacent to $u_{3}$. Therefore $u_{2}$ must be adjacent to $u_{4}$ (or equivalently $u_{5}$ ) and then $u_{5}$ is adjacent to $u_{3}$ and
$u_{4}$ which implies $G \cong G_{1}$. Suppose if $z$ is adjacent to $u_{2}$ and $u_{4}$ then $u_{2}$ is non adjacent to $u_{4}$ and so $u_{2}$ is adjacent to $u_{3}$ or $u_{5}$. If $u_{2}$ is adjacent to $u_{3}$, then $\left\{y, u_{2}\right\}$ is not a complementary 3 -dominating
 cubic, $u_{3}$ is adjacent to $u_{4}$ and $u_{5}$ which implies $G \cong G_{2} . \quad \gamma_{3}^{\prime}$ dominating set of G. Let $u \in(G)$.
Suppose $z$ is non adjacent to $u_{1}$ then with no loss of generality, let $(z)=\left\{u_{2}, u_{3}, u_{4}\right\}$. Then $u_{2}$ is adjacent to $u_{1}$ or $u_{3}$ or $u_{5}$ or $u_{4}$. If $u_{2}$ is adjacent to $u_{3}$ then $\left\{u_{2}, y\right\}$ is not a complementary 3dominating set. Suppose if $u_{2}$ is adjacent to $u_{1}$ and since G is cubic, $u_{5}$ is adjacent to $u_{4}$ and $u_{3}$ and so $\left\{x, u_{4}\right\}$ is not a complementary 3 -dominating set. If $u_{2}$ is adjacent to $u_{4}$, then $u_{5}$ adjacent to $u_{1}$ and $u_{3}$ and so $\left\{z, u_{1}\right\}$ is not a complementary 3dominating set. Suppose if $u_{2}$ adjacent to $u_{5}$, then $u_{4}$ is adjacent to $u_{5}$ then $\left\{x, u_{4}\right\}$ is not a complementary 3 -dominating set. If $u_{4}$ adjacent to $u_{3}$ then $u_{5}$ adjacent to $u_{1}$ and hence $\left\{u_{3}, u_{5}\right\}$ is not a complementary

3-dominating set. If $u_{1}$ adjacent to $u_{4}$ then 3 adjacent to $u_{5}$ which implies $G \cong G_{1}$.

Subcase:(ii) Two vertices if $N(z)$ is adjacent to $y$, say $u_{1}$ and $u_{2}$
For this case, let us assume that $y$ is adjacent to $u_{4}$. Now $z$ ix adjacent to $u_{1}$ (or equivalently $u_{2}$ ) or non adjacent to $u_{1}$ (or equivalently $u_{2}$ ).
If $z$ is adjacent to $u_{1}$, then $u_{2}$ is adjacent to $u_{3}$ (or equivalently $u_{5}$ ) or $z$ or $u_{4}$. If $u_{2}$ is adjacent to $u_{3}$ then $z$ is non adjacent to $u_{3}$ and $u_{4}$. Also $z$ is non adjacent to $u_{3}$ and $u_{5}$. If $z$ adjacent to $u_{4}$ and $u_{5}$ then $u_{5}$ adjacent to $u_{4}$ and $u_{3}$ and so $S=\left\{x, u_{4}\right\}$ is not a complementary 3 -dominating set. If $u_{2}$ adjacent to $z$ and since $G$ is cubic, $z$ is non adjacent to $u_{4}$ (or equivqlently $u_{3}$ ). Therefore $z$ must be adjacent to $u_{5}$. Now $u_{5}$ adjacent to $u_{3}$ and $u_{4}$ and then $u_{3}$ adjacent to $u_{4}$ which implies $G \cong G_{2}$.
Suppose if $u_{2}$ adjacent to $u_{5}$, then $z$ adjacent to $u_{3}$ and $u_{4}$ or $u_{5}$ and $u_{3}$ (or equivalently $u_{5}$ and $u_{4}$ ).
If $z$ adjacent to $u_{4}$ and $u_{3}$ then $u_{5}$ adjacent to $u_{4}$ and $u_{3}$ and so $\left\{x, u_{4}\right\}$ is not a complementary 3dominating set. If $z$ adjacent to $u_{3}$ and $u_{5}$ then $u_{4}$ adjacent to $u_{3}$ and $u_{5}$ which implies $G \cong G_{2}$.
Suppose if $z$ is non adjacent to $u_{1}$ then let us assume that $z$ be adjacent to $u_{4}$ or $u_{3}$ and $u_{5}$. Now $u_{5}$ adjacent to $u_{3}$ and $u_{4}$ or $u_{1}$ and $u_{2}$ or $u_{1}$ and $u_{4}$ (or equivalently $u_{2}$ and $u_{3}$ ). If $u_{5}$ adjacent to $u_{3}$ and $u_{4}$ then $u_{1}$ adjacent to $u_{2}$ and so $\left\{u_{2}, x\right\}$ is not a complementary 3 -dominating set. If $u_{5}$ adjacent to $u_{1}$ and $u_{4}$ then $u_{2}$ adjacent to $u_{3}$, if $u_{5}$ adjacent to $u_{1}$ and $u_{2}$ then $u_{3}$ adjacent to $u_{4}$ which implies $G \cong$ $G_{1}$.

Subcase:(iii) All the vertices of $N(x)$ are adjacent to $y$, say $u_{1}, u_{2}, u_{3}$
For this case, $u_{2}$ adjacent to $u_{1}$ (or equivalently $u_{3}$ ) or $z$ (or equivalently $u_{4}$ or $u_{5}$ ). Since $G$ is cubic, $u_{2}$ will not be adjacent to $u_{1}$ (or equivalently $u_{3}$ ). Therefore $u_{2}$ must be adjacent to $z$, then $z$ adjacent to $u_{1}$ and $u_{2}$ or $u_{4}$ and $u_{5}$. Since $G$ is cubic, $z$ will not be adjacent to $u_{1}$ and also $Z$ will not be adjacent to $u_{1}$ and $u_{5}$. Therefore $z$ must adjacent to $u_{4}$ and $u_{5}$. Suppose if $z$ adjacent to $u_{4}$ and $u_{5}$, then $u_{1}$ will not be adjacent to $u_{3}$. Therefore $u_{1}$ must be adjacent to $u_{4}$ (or equivalently $u_{5}$ ) and so $u_{5}$ adjacent to $u_{3}$ and $u_{4}$ which implies $G \cong G_{1}$.

Case: (2) $<S>=P_{1} \cup P_{2}$
Let $x y$ be an edge. With no loss of generality, let us assume that $x$ be adjacent to $u_{1}$ and $u_{3}$. Now $Z$ adjacent to $u_{1}$ and $u_{2}$ and adjacent to $u_{3}$ or $u_{4}$ or $Z$ adjacent to $u_{1}$ ( or equivalently $u_{2}$ ) and adjacent to any two of $\left\{u_{3}, u_{4}, u_{5}\right\}$.
Suppose if $z$ adjacent to $u_{1}, u_{2}, u_{3}$, then $u_{4}$ adjacent to $u_{1}$ (or equivalently $u_{2}$ ) or not adjacent to $u_{1}$ (or equivalently to $u_{2}$ ). If $u_{4}$ not adjacent to $u_{1}$ ( or equivalent to $u_{2} u_{2}$ ) then $u_{4}$ adjacent to $u_{3}$, z and $u_{5}$ and so $S=\left\{x, z, u_{4}\right\}$ such that $\langle S\rangle=\bar{K}_{3}$ which will fall under the case (1). If $u_{4}$ adjacent to $u_{1}$ then $u_{5}$ is adjacent or non adjacent to to $u_{4}$, If $u_{5}$ non adjacent to $u_{4}$, then $u_{5}$ adjacent to $u_{2}, u_{3}$ and y and so $S=$ $\left\{u_{1}, u_{5}\right\}$ which is not a complementary 3dominating set. If $u_{5}$ adjacent to $u_{4}$ then $S=$ $\left\{x, z, u_{5}\right\}$ and so $<S>={ }^{-} K_{3}^{-}$which will fall under the case (1).
If $z$ is adjacent to $u_{1}, u_{2}$ and $u_{3}$ then $u_{5}$ is adjacent or non adjacent to $u_{1}$. If $u_{5}$ adjacent to $u_{1}$ then for $S=\left\{x, z, u_{5}\right\}$ and so $\langle S\rangle=K_{3}^{-}$which will come under the case (1). If $u_{5}$ adjacent to $u_{1}$ then $u_{5}$ adjacent to any three of $\left\{y, u_{2}, u_{3}, u_{4}\right\}$. Let $u_{5}$ adjacent to $u_{3}, u_{4}$ and $y$. Hence for $S=$ $\left\{x, z, u_{5}\right\}$ and so $\langle S\rangle=\bar{K}_{3}$ which will fall under the case (1).

Case:(3) $<S>=P_{3}$
Let us assume that $y$ adjacent to $x$ and $z$. Then with no loss of generality, let $y$ adjacent to $u_{1}$. Now $u_{2}$ adjacent to $x$, and one of $\left\{u_{3}, u_{4}, u_{5}\right\}$ or $z$ and two of $\left\{u_{3}, u_{4}, u_{5}\right\}$. Supposs if $u_{2}$ adjacent to $x, z$ and $u_{3}$, then $u_{4}$ adjacent or non adjacent to $z$ (or equivalently $x$ ). If $u_{4}$ non adjacent to $z$, then $u_{4}$ adjacent to $u_{1}, u_{5}$ and $u_{3}$ and so $\mathrm{S}=\left\{\mathrm{y}, u_{2}, u_{4}\right\}$ such that $\langle S\rangle=\bar{K}_{3}$ which will fall under the case (1). If $u_{4}$ adjacent to $z$, then $u_{5}$ adjacent or non adjacent to $u_{4}$. If $u_{5}$ non adjacent to $u_{4}$ then $u_{5}$ adjacent to $x, u_{1}$ and $u_{3}$ and hence $S=\left\{z, u_{5}\right\}$ is not a complementary

3 -dominating set. If
$u_{5}$ adjacent to $u_{4}$ then for $S=\left\{y, u_{2}, u_{5}\right\}$ and so $<$ $S>=\bar{K}_{3}$ which will fall under the case (1).
Suppose if $u_{2}$ adjacent to $z, u_{3}$ and $u_{4}$ then $u_{5}$ is adjacent or non adjacent to $z$. If $u_{5}$ adjacent to $z$, then for $S=\left\{y, u_{2}, u_{5}\right\},\langle S\rangle=\bar{K}_{3}$ which will come under the case (1). If $u_{5}$ non adjacent to $z$, then $u_{5}$ adjacent to three of $\left\{x, u_{1}, u_{3}, u_{4}\right\}$. Let us assume that $u_{5}$ adjacent to $x, u_{1}$ and $u_{3}$. Hence $S=$ $\left\{y, u_{2}, u_{5}\right\}$ and so $<S>=\bar{K}_{3}$ which will come under the case (1). Therefore $\gamma_{3}^{\prime}(G)=(G)=3$ if and only if $G \cong G_{1}$ or $G_{2}$.

Conclusion: In this paper we successfully described the complementary 3-domination number of some graphs, bounds and $\gamma_{3}^{\prime}$ number for cubic gaphs.
