## Abstract

Let  $G$  be a connected graph with atleast two vertices. Let  $M \subseteq V$  be an open detour monophonic set of  $G$ . A subset  $T \subseteq M$  is called a forcing subset for  $M$  if  $M$  is the unique minimum open detour monophonic set containing  $T$ . A forcing open detour monophonic subset for  $M$  is the minimum cardinality of a minimum forcing subset of  $M$ , denoted by  $f_{odm}(M)$ , is the cardinality of a minimum forcing subset of  $M$ . The forcing open detour monophonic number of  $G$ , denoted by  $f_{odm}(G)$ .  $f_{odm}(G) = \min\{f_{odm}(M)\}$ , where the minimum is taken over all odm-set  $M$  of  $G$ . In this paper, we determined the forcing open detour monophonic number of some standard graphs and obtained some results. It is shown that for every pair of integers  $a$  and  $b$  with  $0 \leq a \leq b$ ,  $b \geq 2$  and  $b - a > 3$ , there exists a connected graph  $G$  such that  $f_{odm}(G) = a$  and  $odm(G) = b$ .

## 1. Introduction

For a graph  $G$  consists of a finite non-empty set  $V$  of vertices and a set  $E$  of 2-element subsets of  $V$  called edges. For graph theoretic terminologies, we refer reader [1]. If the vertices  $u$  and  $v$  are joined by the edges  $e$ , then the  $u$  and  $v$  are referred to as neighbors of each other. The neighbors of a vertex  $v$  is called the neighborhood of  $v$ , is denoted by  $N(v)$ . Thus  $\deg(v) = |N(v)|$ . A vertex  $v$  is said to be a universal vertex if  $\deg(v) = n - 1$ . A subgraph  $H$  of  $G$  is called an induced subgraph of  $G$  if whenever  $u$  and  $v$  are vertices of  $H$  and  $uv$  is an edge of  $G$ , then  $uv$  is an edge of  $H$  as well as. A

vertex  $v$  in a graph  $G$  is called a simplicial vertex if the subgraph induced by its neighbourhood is complete. Let  $G$  and  $H$  be two graphs. The join  $G + H$  consists of  $G \circ H$  and all edges joining a vertices of  $G$  and  $H$ . The total graph  $T(G)$  of  $G$  is the graph with the vertex set  $V \cup E$  and two vertices are adjacent whenever they are either adjacent or incident in  $G$ .

The distance between  $u$  and  $v$  is the shortest length of every  $x - y$  path in  $G$ , is denoted by  $d(u, v)$ . A chord of a path  $P$  is an edge which connects two non-adjacent vertices of  $P$ . A  $x - y$  path is called a monophonic path if it is chord less path. The

monophonic distance  $d_m(x,y)$  from  $x$  to  $y$  is defined as the length of a longest  $x - y$  monophonic path in  $G$ . A  $x - y$  monophonic path with its length  $d_m(x,y)$  is called a  $x - y$  monophonic. A set  $M$  of vertices of a graph  $G$  is a monophonic set of  $G$  if for every  $x, y \in M$ , there is a monophonic path in  $G$  for some  $x, y \in M$ . The monophonic number  $m(G)$  is the minimum cardinality of a monophonic set of  $G$ . The monophonic number of a graph was studied in [3,4]. A set  $M \subseteq V$  is called an open detour monophonic set of  $G$  if  $J_{dm}(M) = V$ . An open detour monophonic number  $odm(G)$  is the minimum cardinality of an open detour monophonic set of  $G$ . The open detour monophonic number of a graph was studied in [2]. Let  $M \subseteq V$  be a detour monophonic set of  $G$ . A subset  $T \subseteq M$  is called a forcing subset for  $M$  if  $M$  is the unique minimum detour monophonic set containing  $T$ . A forcing subset for  $M$  is the minimum cardinality of a minimum forcing subset of  $M$ , denoted by  $f_{dm}(M)$ , is the cardinality of a minimum forcing subset of  $M$ . The forcing detour monophonic number of  $G$ , denoted by  $f_{dm}(G)$ .  $f_{dm}(G) = \min\{f_{dm}(M)\}$ , where the minimum is taken over all odm-sets  $M$  of  $G$ . The forcing detour monophonic number of a graph was studied in [5]. A vertex of a

connected graph  $G$  is said to be a detour monophonic simplicial vertex of  $G$  if  $v$  is not an internal vertex of any  $x - y$  detour monophonic path for every  $x, y \in V$ . Each extreme vertex of  $G$  is a detour monophonic simplicial vertex of  $G$ .

**The Forcing Open Detour Monophonic Number Of A Graph**

**Definition 2.1**

Let  $M$  be an open detour monophonic set of  $G$ . A subset  $T \subseteq M$  is called a forcing subset for  $M$  if  $M$  is the unique minimum odm-set containing  $T$ . A forcing subset for  $M$  is the minimum cardinality of a minimum forcing subset of  $M$ , denoted by  $f_{odm}(M)$ , is the cardinality of a minimum forcing subset of  $M$ . The forcing open detour monophonic number of  $G$ , denoted by  $f_{odm}(G)$ .  $f_{odm}(G) = \min\{f_{odm}(M)\}$ , where the minimum is taken over all odm-sets  $M$  of  $G$ .

**Example 2.2**

For the graph  $G$  of Figure 2.1,  $M_1 = \{v_1, v_4, v_5\}$  and  $M_2 = \{v_1, v_4, v_6\}$  are the odm-sets of  $G$  such that  $f_{odm}(M_1) = 1$  and  $f_{odm}(M_2) = 1$  so that  $f_{odm}(G) = 1$ .

The following result follows immediately from the definitions of open detour monophonic number and the forcing open detour monophonic number of a connected graph  $G$ .

**Theorem 2.3**

Let  $G$  be a connected graph of order  $n$ , Then

1.  $G$  has a unique minimum odm-set if and only if  $f_{odm}(G) = 0$ .
2.  $f_{odm}(G) = odm(G)$  if and only if no minimum odm-set containing any of its proper subsets.

**Theorem 2.4**

For the connected graph  $G$  and let  $S$  be the set of all detour monophonic simplicial vertices of  $G$ . Then  $f_{odm}(G) \leq odm(G) - |S|$ .

**Proof.** Let  $M$  be any minimum odm-set of  $G$ . Then  $odm(G) = |M|$ ,  $S \subseteq M$  and  $M$  is the unique odm-set containing  $M - S$ . Thus  $f_{odm}(G) \leq |M - S| = |M| - |S| = odm(G) - |S|$ .

**Theorem 2.5**

For any complete graph  $G = K_n$  ( $n \geq 2$ ),  $f_{odm}(G) = 0$ .

**Proof:** Let  $G = K_n$  ( $n \geq 2$ ), then  $M = V(G)$  is the unique odm-set of  $G$ , by Theorem 2.3,  $f_{odm}(G) = 0$

**Corollary 2.6**

- (i) For any star graph  $G = K_{1,n-1}$  ( $n \geq 2$ ),  $f_{odm}(G) = 0$ .
- (ii) For any non-trivial tree  $T$ ,  $f_{odm}(G) = 0$ .

**Proof:** This result follows by Theorem 2.5.

**Theorem 2.7**

Let  $G$  be a connected graph of order  $n$ ,  $0 \leq f_{odm}(G) \leq odm(G) \leq n$ .

**Proof:** Since every connected graph has a odm-set,  $f_{odm}(G) \geq 0$ . Also since forcing subset is a subset of odm-set of  $G$ ,  $f_{odm}(G) \leq odm(G)$ . Since  $V(G)$  is the unique odm-set of  $G$ ,  $odm(G) \leq n$ . Hence  $0 \leq f_{odm}(G) \leq odm(G) \leq n$ .

**Remark 2.8.** The bounds in Theorem 2.7 are sharp. For  $G = K_n (n \geq 2)$ ,  $f_{odm}(G) = 0$  and  $odm(G) = n$ . The bounds in strict in Theorem 2.7. For the graph  $G$  in Figure 2.1.  $odm(G) = 3$  and  $f_{odm}(G) = 1$ . Thus  $0 < f_{odm}(G) < odm(G) < n$ .

**Theorem 2.9.** For the cycle  $G = C_n (n \geq 3)$ ,

$$f_{odm}(G) = \begin{cases} 0 & \text{if } n = 3, 4 \\ 4 & \text{if } n = 5 \\ 1 & \text{if } n = 6 \\ 3 & \text{if } n \geq 7 \end{cases}$$

**Proof:** Let  $C_n$  be  $v_1, v_2, \dots, v_{n-1}, v_n$ . For  $n = 3, 4$ ,  $M = V(G)$  is the unique  $odm$ -set of  $G$ . By Theorem 2.3,  $f_{odm}(G) = 0$ . Let  $n = 5$ . For any  $x \in V(G)$ , there exists  $M = V(G) - \{x\}$ , is a  $odm$ -set of  $G$ ,  $odm(G) = 4 = f_{odm}(G)$ . For  $n = 6$ , Let  $x$  be a vertex of  $G$  and  $y, z$  be the two antipodal vertices of  $x$  and  $v, w$  be the antipodal vertex of  $u$ . Then  $M_1 = \{x, y, z\}$  and  $M_2 = \{u, v, w\}$  are the only two  $odm$ -sets of  $G$  so that  $f_{odm}(G) = 1$ . For  $n \geq 7$ , Let  $xy \in E(G)$  and  $u, v \in V(G)$  such that  $d(x, u) = d(y, v) = 2$ . Then  $M = \{x, y, u, v\}$  is a  $odm$ -set of  $G$ ,  $odm(G) = 4$ . Since  $n \geq 7$ , there must be at least 7  $odm$ -sets and so  $f_{odm}(M) \geq 2$ . Since any two element subset of  $M$  is not a forcing subset of  $M$ ,  $f_{odm}(M) \geq 3$ . Now  $T = \{x, y, u\}$  is a forcing subset of  $M$  and so  $f_{odm}(M) = 3$ . Since this is true for all  $odm$ -sets  $M$  of  $G$ ,  $f_{odm}(G) = 3$ .

**Theorem 2.10.** For the complete bipartite graph  $G = K_{r,s} (2 \leq r \leq s)$ ,

$$f_{odm}(G) = \begin{cases} 0 & \text{if } r = s = 2 \\ 2 & \text{if } 2 = r \leq s \\ 4 & \text{if } 3 \leq r \leq s \end{cases}$$

**Proof:** If  $r = s = 2$ , then  $G = C_4$ , the result follows by Theorem 2.9,  $f_{odm}(G) = 0$ . If  $r = 2$  and  $s \geq 3$ . Let  $X = \{x_1, x_2, \dots, x_r\}$  and  $Y = \{y_1, y_2, \dots, y_s\}$  be the bipartite sets of  $G$ . Then  $M_{ij} = \{x_i, x_j, y_i, y_j\}$  is the  $odm$ -set of  $G$  for some  $i$  and  $j (1 \leq i, j \leq s)$ .  $odm(G) = 4$ . Since  $X = \{x_1, x_2\}$  is a subset of every  $odm(G)$ -set of  $G$ , by Theorem 2.4,  $f_{odm}(G) \leq odm(G) - |X| = 4 - 2 = 2$ . We prove that  $f_{odm}(G) = 2$ . Since  $s \geq 3$  and  $y_i$  lies on more than two  $odm$ -sets for some  $i (1 \leq i \leq s)$  and  $y_j$  lies on more than two  $odm$ -sets of  $G$  for some  $j (1 \leq j \leq s)$ . Since this is true for  $f_{odm}(M_{ij}) = 2$  for all  $i$  and  $j, (1 \leq i, j \leq s)$ . Hence it follows that  $f_{odm}(G) = 2$ . If  $r, s \geq 3$ ,  $M_{ij} = \{x_i, x_j, y_l, y_m\}$  is the  $odm$ -set of  $G$  for some  $i$  and  $j (1 \leq i, j \leq r)$  and for some  $l$  and  $m (1 \leq l, m \leq s)$ ,  $odm(G) = 4$ . Since  $M_{ij}$  is not the unique  $odm$ -set containing any of its proper subsets so that  $f_{odm}(G) = 4$ .

**Theorem 2.11.** For the wheel  $G = K_n + C_{n-1} (n \geq 4)$ ,  $f_{odm}(G) = \begin{cases} 0 & \text{if } n = 4, 5 \\ 4 & \text{if } n = 6 \\ 1 & \text{if } n = 7 \\ 3 & \text{if } n \geq 8 \end{cases}$

**Proof:** Let  $V(K_1) = x$  and  $V(C_{n-1}) = \{v_1, v_2, \dots, v_{n-1}\}$ . If  $n = 4$ , then  $G = K_4$ , by Theorem 2.5,  $f_{odm}(G) = 0$ . If  $n = 5$ ,  $M = V(C_4)$  is the unique  $odm$ -set of  $G$ , by Theorem 2.3,  $f_{odm}(G) = 0$ . Let  $n \geq 6$ . Since  $x$  is a detour monophonic simplicial vertices of  $G$ ,  $\{x\}$  is a subset of every  $odm$ -set of  $G$ . Let  $n = 6$ . For any vertex  $u \in v(G)$ , there exists  $M = V(G) - \{u\}$  is a  $odm$ -set of  $G$ ,  $odm(G) = 5$ . By Theorem 2.4,  $f_{odm}(G) \leq odm(G) - 1 = 5 - 1 = 4$ . For  $n = 7$ , Let  $h$  be a vertex of  $G$  and  $i, j$  be the two antipodal vertices of  $h$  and  $v, w$  be the antipodal vertex of  $u$ . Then  $M_1 = \{x, h, i, j\}$  and  $M_2 = \{x, u, v, w\}$  are the only two  $odm$ -sets of  $G$  so that  $odm(G) = 4$ . By Theorem 2.4  $f_{odm}(G) \leq 3$ . Since  $\{h\}$  is not containing  $M_2$ ,  $f_{odm} = 1$ . For  $n \geq 8$ , Let  $yz \in E(G)$  and  $u, v \in V(G)$  such that  $d(y, u) = d(z, v) = 2$ . Then  $M = \{x, y, z, u, v\}$  is a  $odm$ -set of  $G$ ,  $odm(G) = 5$ . By Theorem 2.4  $f_{odm}(G) \leq 4$ . Since  $n \geq 8$ , there must be at least 7  $odm$ -sets and so  $f_{odm}(M) \geq 2$ . Since any two element subset of  $M$  is not a forcing subset of  $M$ ,  $f_{odm}(M) \geq 3$ . Now  $T = \{y, z, u\}$  is a forcing subset of  $M$  and so  $f_{odm}(M) = 3$ . Since this is true for all  $odm$ -sets  $M$  of  $G$ ,  $f_{odm}(G) = 3$ .

**Theorem 2.12.** For the fan graph  $G = F_n = K_1 + P_{n-1} (n \geq 3)$ ,  $f_{odm}(G) = 0$ .

**Proof:** Let  $V(K_1) = \{x\}$  and  $V(P_{n-1}) = \{v_1, v_2, \dots, v_{n-1}\}$ . If  $n = 3$ , then  $G = K_3$ , by Theorem 2.5,  $f_{odm}(G) = 0$ . If  $n = 4$ , then  $M = \{v_1, v_3\}$  is the unique  $odm$ -set of  $G$  so that  $f_{odm}(G) = 0$ . Let  $n \geq 5$ , then  $M = \{x, v_1, v_{n-1}\}$  is the unique  $odm$ -set of  $G$ ,  $f_{odm}(G) = 0$ .

**Theorem 2.13.** Let  $G = \overline{K}_2 + \overline{K}_{n-2} (n \geq 6)$ ,  $f_{odm}(G) = 2$ .

**Proof:** Let  $V(K_2) = \{x, y\}$  and  $V(K_{n-2}) = \{v_1, v_2, \dots, v_{n-2}\}$ . Since  $X = \{x, y\}$  is a subset of every  $odm$ -set of  $G$ . Now  $M_{ij} = \{x, y\} \cup \{v_i, v_j\} i \neq j (1 \leq i, j \leq n - 2)$  is a  $odm$ -set of  $G$ ,  $odm(G) = 4$ . By Theorem 2.4,  $f_{odm}(G) = odm(G) - |X| = 4 - 2 = 2$ . Since  $\{v_i, v_j\}$  is not containing any  $odm$ -set of it proper subsets  $f_{odm}(G) = 2$ .

**Theorem 2.14.** For any Ladder graph  $G = L_n = P_2 \times P_n (n \geq 2)$ ,  $f_{odm}(G) = 0$ .

**Proof:** Let  $V(G) = \{v_1, v_2, \dots, v_{n-2}\} \cup \{u_1, u_2, \dots, u_n\}$ . Let  $M = \{v_1, u_1, u_n\}$  be unique  $odm$ -set of  $G$ . By Theorem 2.3,  $f_{odm}(G) = 0$

**Theorem 2.15.** For the total graph of path  $G = T(P_n)$  ( $n \geq 3$ ),  $f_{odm}(G) = 0$ .

**Proof:** Let  $V(G) = \{v_1, v_2, \dots, v_{n-2}\} \cup \{u_1, u_2, \dots, u_{n-1}\}$ . For  $n = 3$ , then  $M = \{v_1, v_2, v_3\}$  is the unique  $odm$ -set of  $G$ ,  $f_{odm}(G) = 0$ . For  $n \geq 4$ ,  $X = \{v_1, v_n\}$ . Since  $X = \{v_1, v_n\}$  is the detour monophonic simplicial vertices of  $G$ . Let  $M = \{v_1, v_n\}$  is the unique  $odm$ -set of  $G$ ,  $f_{odm}(G) = 0$ .

**Theorem 2.16**

For every pair of integers  $a$  and  $b$  with  $0 \leq a \leq b$ ,  $b \geq 2$  and  $b - a > 3$ , there exists a connected graph  $G$  such that  $f_{odm}(G) = a$  and  $odm(G) = b$ .

**Proof:** For  $a = 0$ , let  $G = K_b$ . Then by Theorem 2.5,  $f_{odm}(G) = 0$  and  $odm(G) = b$ . Thus we assume  $0 \leq a \leq b$ ,  $b \geq 2$ .

Let  $P: x, y$  be a path on two vertices and  $P_i: x_i, y_i, z_i$  ( $1 \leq i \leq a$ ) be a copy of a path on 3 vertices. Let  $H$  be the graph obtained from  $P$  and  $P_i$  ( $1 \leq i \leq a$ ) and introduce a vertex  $w$  and introduce the edges  $xx_i$  ( $1 \leq i \leq a$ ),  $yz_i$  ( $1 \leq i \leq a$ ) and  $wx_i$  ( $1 \leq i \leq a$ ),  $wz_i$  ( $1 \leq i \leq a$ ). Let  $G$  be the graph obtained from  $H$  by adding the new vertices  $v_1, v_2, u_j$  ( $1 \leq j \leq b - a - 2$ ) and introducing the edges  $yu_j$  ( $1 \leq j \leq b - a - 3$ ),  $xu_{b-a-2}, wv_1$  and  $wv_2$ . The graph  $G$  is shown in Figure 2.2.

Figure 2.2

First we prove that  $odm(G) = b$ . Let  $X = \{u_1, u_2, \dots, u_{b-a-2}, v_1, v_2\}$  be the set of all extreme vertices of  $G$ . By Theorem 1.1,  $X$  contains every minimum  $odm$ -set of  $G$ ,  $odm(G) \geq b - a - 2 + 2 = b - a$ . We observe that every minimum  $odm$ -set contains exactly one vertex from  $H_i = \{x_i, z_i\}$  ( $1 \leq i \leq a$ ). Thus  $odm(G) \geq b - a + a = b$ . Let  $M = X \cup \{x_1, x_2, \dots, x_a\}$ . Then  $M$  is an  $odm$ -set of  $G$  so that  $odm(G) = b$ . Next we prove that  $f_{odm}(G) = a$ . Since every minimum  $odm$ -set contains  $X$ , by Theorem 2.4,  $f_{odm}(G) \leq odm(G) - |X| = b - (b - a) = a$ . We prove that  $f_{odm}(G) = a$ . On the contrary, suppose that  $f_{odm}(G) < a$ . Now since  $odm(G) = b$  and every  $odm$ -set contains  $X$  and every  $odm$ -set of  $G$  contains at least one vertex from each  $H_i$  ( $1 \leq i \leq a$ ). It is easily seen that every  $odm$ -set  $M$  is of the  $X \cup \{e_1, e_2, \dots, e_a\}$ , where  $e_i \in H_i$  ( $1 \leq i \leq a$ ). Let  $T$  be any proper subset of  $M$  with  $|T| < a$ . Then there exists  $e_j \in H_j$  ( $1 \leq j \leq a$ ) such that  $e_j \in T$ . Let  $f_j$  be the vertex of  $H_i$  ( $1 \leq i \leq a$ ) distinct from  $e_j$ . Then  $M' = (M - \{e_j\}) \cup \{f_j\}$  is an  $odm$ -set of  $G$  properly containing  $T$ . Thus  $M$  is not the unique  $odm$ -set of  $G$  containing  $T$  so that  $T$  is not a forcing subset of  $M$ . This is true for all  $odm$ -sets containing  $G$  so that  $f_{odm}(M) = a$ .

**2. Conclusion**

This paper exhibits the forcing open detour monophonic number of some standard graphs.
