#### Abstract

In this manuscript, a remarkable 4-tuples $(\alpha, \beta, \gamma, \delta)$ with elements are non-zero integers such that the arithmetic mean of any three elements among the four elements listed in this 4 -tuples yields a square number is appraised by applying several techniques in Mathematics.

Keywords: Diophantine quadruples, Ternary quadratic, Diophantine equation

## 1. Introduction

"A set of $m$ positive integers $\left\{a_{1}, a_{2} \ldots a_{m}\right\}$ is called a Diophantine $m-$ tuple with the property $D(n), n-\{0\} \in Z$ if $a_{i} . a_{j}+n$ is a perfect square for all $1 \leq i<j \leq m$ ". In $[3,4]$, the authors initiated how to find Diophantine triples with suitable properties. In [5,6], the authors concentrated on evaluating Diophantine quadruples with an elegant property. For further review of quadruples one can refer $[1,2,7-9]$. In this paper, an integer quadruples ( $\alpha, \beta, \gamma, \delta$ ) where $\alpha, \beta, \gamma$ and $\delta$ are non-zero integers where the average of any three elements amid the four numbers deliver a square number is explained by following different methods.

## 2. Procedures of Examinations.

Let $\alpha, \beta, \gamma, \delta$ be distinct non-zero integers such that the average of any three among these four elements stay a perfect square. Originate with the exact postulation as given below:

$$
\begin{align*}
& \alpha+\beta+\gamma=3 p^{2}  \tag{1}\\
& \alpha+\beta+\delta=3 q^{2}  \tag{2}\\
& \alpha+\gamma+\delta=3 r^{2}  \tag{3}\\
& \beta+\gamma+\delta=3 s^{2} \tag{4}
\end{align*}
$$

concurrently with the supplementary proposition that

$$
\begin{equation*}
\alpha+\beta+\gamma+\delta=z^{2} \tag{5}
\end{equation*}
$$

By making simple arithmetical calculations in the simultaneous equations (1), (2), (3) and (4), the values of $\alpha, \beta, \gamma$ and $\delta$ are declared as follows

$$
\begin{align*}
& \alpha=p^{2}+q^{2}+r^{2}-2 s^{2}  \tag{6}\\
& \beta=p^{2}+q^{2}+s^{2}-2 r^{2}  \tag{7}\\
& \gamma=p^{2}+r^{2}+s^{2}-2 q^{2}  \tag{8}\\
& \delta=q^{2}+r^{2}+s^{2}-2 p^{2} \tag{9}
\end{align*}
$$

Addition of all the above four equations from (6) to (9) offers the successive equation

$$
\begin{equation*}
\alpha+\beta+\gamma+\delta=p^{2}+q^{2}+r^{2}+s^{2} \tag{10}
\end{equation*}
$$

Comparing equation (5) and (10), it is noted that

$$
\begin{equation*}
z^{2}=p^{2}+q^{2}+r^{2}+s^{2} \tag{11}
\end{equation*}
$$

## Procedure 1.

Undertaking the new linear modifications $p=m+n, q=m+7 n, r=m-n, s=m-7 n$ where $m \neq n \neq 0$ in (6), (7), (8) and (9), the corresponding values of $\alpha, \beta, \gamma$ and $\delta$ in two variables are offered subsequently by

$$
\begin{align*}
& \alpha=m^{2}-47 n^{2}+42 m n  \tag{12}\\
& \beta=m^{2}+97 n^{2}+6 m n  \tag{13}\\
& \gamma=m^{2}-47 n^{2}-42 m n  \tag{14}\\
& \delta=m^{2}+97 n^{2}-6 m n \tag{15}
\end{align*}
$$

Relieving the same conversions in (11) ensurethe following famous Pythagoreans equation

$$
\begin{equation*}
z^{2}=(2 m)^{2}+(10 n)^{2} \tag{16}
\end{equation*}
$$

The process of executing the quadruples $(\alpha, \beta, \gamma, \delta)$ wherethe average of three among four elements stand for a square number by solving (16) in two different proposals are enlightened below.

## Proposal 1.1.

The Pythagorean equation (16) is fulfilled by

$$
\begin{align*}
& m=\frac{\left(r^{2}-s^{2}\right)}{2}  \tag{17}\\
& n=\frac{r s}{10} \tag{18}
\end{align*}
$$

Meanwhile our concern is to treasure the parameters in integers, it is experiential that $m$ and $n$ are integers for the ensuing options of $r$ and $s$

$$
r=2 R \text { and } s=10 S
$$

These selections of $r$ and $s$ reduce (17) and (18)as

$$
\begin{aligned}
& m=2 R^{2}-50 S^{2} \\
& n=4 R S
\end{aligned}
$$

Replacement of the above values of $m$ and $n$ in (12),(13), (14) and (15) convert the preferable values of $\alpha, \beta$, $\gamma$ and $\delta$ as follows

$$
\begin{aligned}
& \alpha=4 R^{4}+336 R^{3} S-952 R^{2} S^{2}-8400 R S^{3}+2500 S^{4} \\
& \beta=4 R^{4}+48 R^{3} S+1352 R^{2} S^{2}-1200 R S^{3}+2500 S^{4} \\
& \gamma=4 R^{4}-336 R^{3} S-952 R^{2} S^{2}+8400 R S^{3}+2500 S^{4} \\
& \delta=4 R^{4}-48 R^{3} S+1352 R^{2} S^{2}+1200 R S^{3}+2500 S^{4}
\end{aligned}
$$

The table below contains numerical values for a few parameters that support the proposal.

| $R$ | $S$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | -277244 | 187588 | 613828 | 314884 | $(418)^{2}$ | $(274)^{2}$ | $(466)^{2}$ | $(610)^{2}$ |
| 3 | 2 | -177404 | 62788 | 189508 | 115204 | $(158)^{2}$ | $(14)^{2}$ | $(206)^{2}$ | $(350)^{2}$ |
| 4 | 1 | -23804 | 23428 | 388 | 26884 | $(2)^{2}$ | $(94)^{2}$ | $(34)^{2}$ | $(130)^{2}$ |
| 6 | 2 | -349952 | 203008 | 166144 | 276736 | $(80)^{2}$ | $(208)^{2}$ | $(176)^{2}$ | $(464)^{2}$ |

## Proposal 1. 2.

Let us designate an additional solution of (16) be

$$
\begin{equation*}
m=r s \tag{19}
\end{equation*}
$$

$$
\begin{equation*}
n=\frac{\left(r^{2}-s^{2}\right)}{10} \tag{20}
\end{equation*}
$$

For receiving an integer solution of equation (16), let us prefer the fortuitous of $r$ and $s$ as given below.

$$
\begin{aligned}
& r=10 R \text { and } \\
& s=10 S
\end{aligned}
$$

Hence, (19) and (20) are developed into

$$
\begin{aligned}
& m=100 R S \\
& n=10 R^{2}-10 S^{2}
\end{aligned}
$$

Substituting the above-mentioned values of $m$ and $n$ in (12), (13), (14) and (15)), the comparable values of $\alpha, \beta, \gamma$ and $\delta$ are turned into

$$
\begin{aligned}
& \alpha=-4700 R^{4}+42000 R^{3} S+19400 R^{2} S^{2}-42000 R S^{3}-4700 S^{4} \\
& \beta=9700 R^{4}+6000 R^{3} S-9400 R^{2} S^{2}-6000 R S^{3}+9700 S^{4} \\
& \gamma=-4700 R^{4}-42000 R^{3} S+19400 R^{2} S^{2}+42000 R S^{3}-4700 S^{4} \\
& \delta=9700 R^{4}-6000 R^{3} S-9400 R^{2} S^{2}+6000 R S^{3}+9700 S^{4}
\end{aligned}
$$

Algebraic Computations of an essential triples are enumerated below for few chances of the newly introduced parameters $R$ and $S$.

| $R$ | $S$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | -1017500 | 422500 | 1502500 | 782500 | $(550)^{2}$ | $(250)^{2}$ | $(650)^{2}$ | $(950)^{2}$ |
| 3 | 2 | 1502500 | 782500 | -1017500 | 422500 | $(650)^{2}$ | $(950)^{2}$ | $(550)^{2}$ | $(250)^{2}$ |
| 4 | 1 | 1622500 | 2702500 | -3417500 | 1982500 | $(550)^{2}$ | $(1450)^{2}$ | $(250)^{2}$ | $(650)^{2}$ |
| 6 | 2 | 12755200 | 13676800 | -19500800 | 9068800 | $(1520)^{2}$ | $(3440)^{2}$ | $(880)^{2}$ | $(1040)^{2}$ |

## Procedure 2.

A tactic of an alternative translations $p=m+n, q=m-n, r=m+3 n$ and $s=m-3 n$ where $m \neq n \neq 0$ in (6), (7), (8) and (9)deliver the assessment of $\alpha, \beta, \gamma$ and $\delta$ as follows

$$
\begin{equation*}
\alpha=m^{2}-7 n^{2}+18 m n \tag{21}
\end{equation*}
$$

$$
\begin{align*}
& \beta=m^{2}-7 n^{2}-18 m n  \tag{22}\\
& \gamma=m^{2}+17 n^{2}+6 m n  \tag{23}\\
& \delta=m^{2}+17 n^{2}-6 m n \tag{24}
\end{align*}
$$

Reservation of the same alterations in (11)leads to an equation of the form as below

$$
\begin{equation*}
z^{2}=(2 m)^{2}+20 n^{2} \tag{25}
\end{equation*}
$$

Applying few methods of solving (25), an estimation of a gorgeous integer quadruple fulfilling the condition that the average of three quantities stays a square number is established as follows.

## Proposal 2. 1.

By considering the general solutions to the equation of the form $z^{2}=D x^{2}+y^{2}$ where $D$ is a square free integer, the choice of $m, n$ and $z$ attained from (25) are as given below

$$
\begin{align*}
& m=\frac{1}{2}\left[a^{2}-20 b^{2}\right] \\
& n=2 a b  \tag{26}\\
& z=a^{2}+20 b^{2}
\end{align*}
$$

In order to find out an integer solution, striking the replacement as $a=2 A$ and $b$ is an arbitrary value in (26), the equivalent values $m, n$ and $z$ are revealed by

$$
\begin{aligned}
& m=2 A^{2}-10 b^{2} \\
& n=4 A b \\
& z=4 A^{2}+20 b^{2}
\end{aligned}
$$

Exchanging the values of $m$ and $n$ in (21), (22), (23) and (24), the exact chances of the non-zero parameters $\alpha, \beta, \gamma$ and $\delta$ are turned out to be

$$
\begin{aligned}
& \alpha=4 A^{4}+144 A^{3} b-152 A^{2} b^{2}-720 A b^{3}+100 b^{4} \\
& \beta=4 A^{4}-144 A^{3} b-152 A^{2} b^{2}+720 A b^{3}+100 b^{4} \\
& \gamma=4 A^{4}+48 A^{3} b+232 A^{2} b^{2}-240 A b^{3}+100 b^{4} \\
& \delta=4 A^{4}-48 A^{3} b+232 A^{2} b^{2}+240 A b^{3}+100 b^{4}
\end{aligned}
$$

## Numerical illustrations for some positive values of $\boldsymbol{A}$ and $\boldsymbol{b}$ filling the supposition are presented in the below table.

| $A$ | $b$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | -32732 | 38116 | 4708 | 28324 | $(58)^{2}$ | $(106)^{2}$ | $(10)^{2}$ | $(154)^{2}$ |
| 3 | 2 | -13052 | 5956 | 7108 | 13444 | $(2)^{2}$ | $(46)^{2}$ | $(50)^{2}$ | $(94)^{2}$ |
| 4 | 1 | 5028 | -7644 | 6948 | 2724 | $(38)^{2}$ | $(6)^{2}$ | $(70)^{2}$ | $(26)^{2}$ |
| 6 | 2 | 12544 | -42752 | 49408 | 30976 | $(80)^{2}$ | $(16)^{2}$ | $(176)^{2}$ | $(112)^{2}$ |

## Proposal 2.2.

## Subcase 2.2.1.

Factorization of (25) provides the following equation

$$
\begin{equation*}
(z+2 m)(z-2 m)=20 n^{2} \tag{27}
\end{equation*}
$$

The overhead equation can be inscribed in the fraction form as

$$
\begin{equation*}
\frac{(z-2 m)}{(20 n)}=\frac{(n)}{(z+2 m)}=\frac{a}{b}, b \neq 0 \tag{28}
\end{equation*}
$$

Modify (28) into the subsequent form of double equations

$$
\begin{align*}
& z b-2 b m-20 a n=0  \tag{29}\\
& a z+2 a m-b n=0 \tag{30}
\end{align*}
$$

Resolving (29) and (30) by cross multiplication rule, the values of $m$, nand $z$ needed for accomplishing an integer solution of (25) are furnished as

$$
\begin{aligned}
& m=-20 a^{2}+b^{2} \\
& n=4 a b \\
& z=40 a^{2}+2 b^{2}
\end{aligned}
$$

Transmitting the values of $m$ and $n$ in (21), (22),(23) and (24), the precise options of $\alpha, \beta, \gamma$ and $\delta$ are converted into

$$
\begin{aligned}
& \alpha=400 a^{4}-144 a^{3} b-152 a^{2} b^{2}+72 a b^{3}+b^{4} \\
& \beta=400 a^{4}+144 a^{3} b-152 a^{2} b^{2}-72 a b^{3}+b^{4} \\
& \gamma=400 a^{4}-480 a^{3} b+232 a^{2} b^{2}+24 a b^{3}+b^{4}
\end{aligned}
$$

$$
\delta=400 a^{4}+480 a^{3} b+232 a^{2} b^{2}-24 a b^{3}+b^{4}
$$

Examples for few positive values of $\boldsymbol{a}$ and $\boldsymbol{b}$ gratifying the proposition are given in the succeeding table.

| $a$ | $b$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | -29663 | 31681 | 4609 | 25057 | $(47)^{2}$ | $(95)^{2}$ | $(1)^{2}$ | $(143)^{2}$ |
| 3 | 5 | -168575 | 166225 | 29425 | 141025 | $(95)^{2}$ | $(215)^{2}$ | $(25)^{2}$ | $(335)^{2}$ |
| 4 | 1 | 8097 | 191841 | 75489 | 136737 | $(303)^{2}$ | $(335)^{2}$ | $(271)^{2}$ | $(367)^{2}$ |
| 6 | 2 | -122096 | 1115152 | 3456616 | 758032 | $(668)^{2}$ | $(764)^{2}$ | $(572)^{2}$ | $(860)^{2}$ |

## Subcase 2.2.2.

Rewrite (27) in the ratio as

$$
\frac{(z-2 m)}{n}=\frac{20 n}{(z+2 m)}=\frac{a}{b}, b \neq 0
$$

Applying the same technique as explained in subcase (i), the particular selections of the elements in the quadruple are expressed by

$$
\begin{aligned}
& \alpha=a^{4}-72 a^{3} b-152 a^{2} b^{2}+1440 a b^{3}+400 b^{4} \\
& \beta=a^{4}+72 a^{3} b-152 a^{2} b^{2}-1440 a b^{3}+400 b^{4} \\
& \gamma=a^{4}-24 a^{3} b+232 a^{2} b^{2}+480 a b^{3}+400 b^{4} \\
& \delta=a^{4}+24 a^{3} b+232 a^{2} b^{2}-480 a b^{3}+400 b^{4}
\end{aligned}
$$

Some models are acknowledged in the subsequent table.

| $a$ | $b$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | 102976 | -49088 | 66112 | 15424 | $(200)^{2}$ | $(152)^{2}$ | $(240)^{2}$ | $(104)^{2}$ |
| 3 | 5 | 746161 | -314399 | 479041 | 125521 | $(551)^{2}$ | $(431)^{2}$ | $(671)^{2}$ | $(311)^{2}$ |
| 4 | 1 | -624 | -2928 | 4752 | 3984 | $(20)^{2}$ | $(12)^{2}$ | $(52)^{2}$ | $(44)^{2}$ |
| 6 | 2 | 23824 | -52208 | 53776 | 28432 | $(92)^{2}$ | $(4)^{2}$ | $(188)^{2}$ | $(100)^{2}$ |

## Subcase 2.2.3.

Redraft (27) as

$$
\frac{(z+2 m)}{20 n}=\frac{n}{(z-2 m)}=\frac{a}{b}, b \neq 0
$$

By manipulating the identical procedure as clarified in subcase (i), the specific collections of the elements in an essential quadruples are articulated by

$$
\begin{aligned}
& \alpha=400 a^{4}+1440 a^{3} b-152 a^{2} b^{2}-72 a b^{3}+b^{4} \\
& \beta=400 a^{4}-1440 a^{3} b-152 a^{2} b^{2}+72 a b^{3}+b^{4} \\
& \gamma=400 a^{4}+480 a^{3} b+232 a^{2} b^{2}-24 a b^{3}+b^{4} \\
& \delta=400 a^{4}-480 a^{3} b+232 a^{2} b^{2}+24 a b^{3}+b^{4}
\end{aligned}
$$

The following table offered numerical values for limited choice of the parameters rewarding the hypothesis.

| $a$ | $b$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | 17169 | -5583 | 11121 | 3537 | $(87)^{2}$ | $(71)^{2}$ | $(103)^{2}$ | $(55)^{2}$ |
| 3 | 2 | 102976 | -49088 | 66112 | 15424 | $(200)^{2}$ | $(152)^{2}$ | $(248)^{2}$ | $(104)^{2}$ |
| 3 | 4 | 152464 | -130928 | 113296 | 18832 | $(212)^{2}$ | $(116)^{2}$ | $(308)^{2}$ | $(20)^{2}$ |
| 6 | 3 | 1390689 | -452223 | 900801 | 286497 | $(783)^{2}$ | $(639)^{2}$ | $(927)^{2}$ | $(495)^{2}$ |

Subcase 2.2.4.
Alternate (27) as

$$
\frac{(z+2 m)}{n}=\frac{20 n}{(z-2 m)}=\frac{a}{b}, b \neq 0
$$

As in subcase (i), the gathering of the elements in the crucial quadruple are expressed by

$$
\begin{aligned}
& \alpha=a^{4}+72 a^{3} b-152 a^{2} b^{2}-1440 a b^{3}+400 b^{4} \\
& \beta=a^{4}-72 a^{3} b-152 a^{2} b^{2}+1440 a b^{3}+400 b^{4} \\
& \gamma=a^{4}+24 a^{3} b+232 a^{2} b^{2}-480 a b^{3}+400 b^{4}
\end{aligned}
$$

$$
\delta=a^{4}-24 a^{3} b+232 a^{2} b^{2}+480 a b^{3}+400 b^{4}
$$

Numerical characters for selected choices of $\boldsymbol{a}$ and $\boldsymbol{b}$ gratifying the proposal are presented in the below table.

| $a$ | $b$ | $\alpha$ | $\beta$ | $\gamma$ | $\delta$ | $\frac{\alpha+\beta+\gamma}{3}$ | $\frac{\alpha+\beta+\delta}{3}$ | $\frac{\alpha+\gamma+\delta}{3}$ | $\frac{\beta+\gamma+\delta}{3}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 3 | -2496 | 2112 | 576 | 2112 | $(8)^{2}$ | $(24)^{2}$ | $(8)^{2}$ | $(40)^{2}$ |
| 3 | 2 | -29663 | 31681 | 4609 | 25057 | $(47)^{2}$ | $(95)^{2}$ | $(1)^{2}$ | $(143)^{2}$ |
| 3 | 4 | -188111 | 349297 | 46321 | 225457 | $(263)^{2}$ | $(359)^{2}$ | $(167)^{2}$ | $(455)^{2}$ |
| 6 | 3 | -202176 | 171072 | 46656 | 171072 | $(72)^{2}$ | $(216)^{2}$ | $(72)^{2}$ | $(360)^{2}$ |

The Python Program for the authentication of the needed quadruples fulfilling our statement is epitomized below.

```
import mat
w}\squareile True
    T = input("Enter your c\squareoice part A of B :")
    if T in ('A'):
    c = input("Enter c\squareoice(1/2): ")
    if c in ('1', '2'):
        r= int(input('Enter a Number r : ))
        s=\operatorname{int(input('Enter t\squaree second number s: ))}
    if (c== '1'):
        m=2*r ** 2-50*s** 2
        n=4*r*s
    elif(c== '2'):
        m=100*r*s
        n=10*r**2-10*s**2
    else:
        print('Invalid Input')
        break
    p=m**2-47*n**2+42*m*n
    q=m**2+97*n**2+6*m*n
    r=m**2-47*n**2-42*m*n
    s=m**2+97*n**2-6*m*n
    a1=(p+q+r)/3
    a2=(p+q+s)/3
```

```
a3=(p+r+s)/3
a4=(q+r+s)/3
if (a1<0):
    a11=-1*a1
    x = pow(a11,1/2)
else:
    x = pow(a1,1/2)
if (a1<0):
    x=-x
if (a2<0):
    a21 = -1 *a2
    y=pow(a21,1/2)
else:
    y=pow(a2,1/2)
if (a2<0):
    y= -y
if (a3<0):
    a31=-1*a3

## Conclusion.

In this communication, the quadruple $(\alpha, \beta, \gamma, \delta)$ in which the average of any three numbers remains a square of an integer is examined. To conclude, one can explore stimulating quadruples and quintuples such that geometric mean of two or three numbers is a square of an integer.
