#### Abstract

In this study we prove a common fixed point theorem for $D$-operator pairs that meet the general contractive condition on cone metric type spaces. The D-operator pair is an extension of mappings that are weakly compatible. The examples are provided to demonstrate the outcome. As an application, Best Approximation is also demonstrated as an application.

Keywords: D-Operator Pair, Fixed Point, Point Of Co-Incidence.

## 1. INTRODUCTION

Huang and Zhang [5] established the explanation of cone metric space by replacing the real numbers $R$ in metric space with an ordered Banach space. Jungck[9] specified compatible maps and after a year or so, he added weak compatibility. AlThagafi and shahzad [4] outlined occasionally weakly compatible, which is more general than weakly compatible maps. Later M. Abbas and G. Jungck [1] proposed the idea of a D-operator pair, which is a more widespread concept in space of metric than occasionally weak compatibility. This paper discusses a few common fixed point theorems in cone metric type spaces under some general contractive conditions.

## 2. PRELIMINARIES

## Definition 2.1 [2]

Let X be a non-empty set and $£$ be a real Banach space with cone p . A vector-valued function $\mathrm{d}: X \times X \rightarrow \mathrm{p}$ is said to be a cone metric type function on $X$ with the constant $\mathrm{K} \geq 1$ if the following conditions are satisfied:
(1) $\theta \leq \mathrm{d}(x, y)$, for all $x, y \in X$, and $\mathrm{d}(x, y)=\theta$ iff $x=y$;
(2) $\mathrm{d}(x, y)=\mathrm{d}(y, x)$ for all $x, y \in X$;
(3) $\mathrm{d}(x, z) \leq K(d(x, y)+d(y, z))$ for all $x, y, z$ $\in X$.

The pair $(X, d)$ is called the cone metric type space. If $K=1$ then the ordinary triangle inequality in a cone metric space is satisfied, however it does not hold true if $K>1$. Thus the class of cone metric type spaces is effectively larger than that of ordinary cone metric spaces.Every cone metric space is a cone metric type space, but the converse need not be true.

Example 2.2 [2]
Let $\mathrm{X}=\{-1,0,1\}, \mathrm{E}=\mathbf{R}^{2}, \mathrm{p}=\{(x, y): x \geq 0, y \geq$ $0\}$. Define $\mathrm{d}: X \times X \rightarrow \mathrm{p}$ by $\mathrm{d}(x, y)=d(y, x)$ for all $x, y \in X, d(x, x)=\theta, x \in X$ and $d(-1,0)=$ $(3,3), d(-1,1)=d(0,1)=(1,1)$. Then $(X, d)$ is a complete cone metric space but the triangle inequality is not satisfied.

We have that, $\mathrm{d}(-1,1)+d(1,0)=(1,1)+(1,1)=$ $(2,2) \leq(3,3)=d(-1,0)$. It is clear that $K=\frac{3}{2}$.

## Definition 2.3

Let (X,d) be a cone metric type space. We say that $\left\{x_{g}\right\}$ is
(a) A cauchy sequence if $\forall$ ç in $£$ with ç $\gg 0$, there is N s.t $\forall \vartheta, g>N, \mathrm{~d}\left(x_{\vartheta}, x_{g}\right) \ll$ ç
(b) A convergent sequence if for every c in $£$ with ç $\gg 0$, there is N such that for all $g>N$, $\mathrm{d}\left(x_{g}, x\right) \ll \mathrm{c}$ for some fixed $x$ in X .

A cone metric type space $X$ is said to be complete if every Cauchy sequence in X is convergent in X . It is known that $\left\{x_{g}\right\}$ convergent to $x$ in X if and only if $\mathrm{d}\left(x_{g}, x\right) \rightarrow 0$ as $g \rightarrow \infty$.

Definition 2.4 [9]
Let X be a set and let f , g be a two self mapping of X . A point $x \in \mathrm{X}$ is called a coincidence point of f and g iff $\mathrm{f} x=\mathrm{g} x$. We shall call $\mathrm{w}=\mathrm{f} x=\mathrm{g} x$ a point of coincidence of $f$ and $g$.

## Definition 2.5

Two self-maps f and g of a set X are occasionally weakly compatible iff there is a point $x \in \mathrm{X}$ which is a coincidence point of $f$ and $g$ at which $f$ and $g$ commute.

## Definition 2.6

Let X be a non empty set and $d$ be a function, $d$ : X $\times X \rightarrow £ \ni$
$\mathrm{d}(\lambda, \mu)=0$ if and only if $\lambda=\mu \forall \lambda, \mu \in X \rightarrow$ (2.6)
for a space $(X, d)$ satisfying (2.6) and $A \subset X$, the diameter of A is defined by

$$
\operatorname{diam}(\mathrm{A})=\sup \{\max \{(\mathrm{d}(\lambda, \mu), \mathrm{d}(\mu, \lambda,) \lambda, \mu \in \mathrm{A}\}\}
$$

## Definition 2.7[1]

Let $\lambda, \mu: \mathrm{X} \rightarrow \mathrm{X}$ be mappings. The pair $(\sigma, \tau)$ is said to be $\mathbf{D}$-operator pair if there is a point u in X s.t $\alpha$ $\in \mathrm{C}(\sigma, \tau)$ and $\mathrm{d}(\sigma \tau \mathrm{u}, \tau \sigma \mathrm{u}) \leq \mathrm{R}$ diam $(\mathrm{PC}(\sigma, \tau))$ for some $\mathrm{R}>0$.

## Definition 2.8

Let $M$ be a nonempty subset of a cone metric space (M,d).The set of best M-approximants to
$\mathrm{u} \in \mathrm{X}$, denoted as $P_{M}(\mathrm{u})$ is defined by

$$
P_{M}(\mathrm{u})=\{y \in \mathrm{M}: \mathrm{d}(\mathrm{y}, \mathrm{u})=\operatorname{dist}(\mathrm{u}, \mathrm{M})\}
$$

where $\operatorname{dist}(u, M)=\inf \{d(x, u): x \in M\}$.

## 3. MAIN RESULTS

## Theorem 3.1

Let (X,d) be a cone metric type space with constant $K \geq 1$ and P be a cone with a nonempty interior. Suppose that the mappings $\lambda, \mu: \mathrm{X} \rightarrow \mathrm{X}$ are such that $\lambda(\mathrm{X}) \subseteq \mu(\mathrm{X})$ and $\lambda(\mathrm{X})$ or $\mu(\mathrm{X})$ is a complete subspace of X . Suppose $(\lambda, g)$ is a D-operator pair and satisfy the conditio
$\mathrm{d}(\lambda x, \lambda y) \leq \frac{\theta}{K}\left\{\max \left\{k d(\mu x, \mu y), k d(\mu x, \lambda x), k d(\mu y, \lambda y), \frac{d(\mu y, \lambda x)+d(\mu x, \lambda y)}{2}\right\}\right\}$
$\forall x, y \in \mathrm{X}$ and for some constant $\theta \in\left(0, \frac{1}{K}\right)$. Then $\lambda$ and $\mu$ have a unique common fixed point.

## Proof:

By the definition of D -operator pair there exist u in X and $\mathrm{R}>0$ such that $\lambda u=\mu u$ and
$\mathrm{d}(\lambda \mu \mathrm{u}, \mu \lambda \mathrm{u}) \leq \operatorname{Rdiam}(\operatorname{PC}(\lambda, \mu))$
First, we prove that $P C(\lambda, g)$ is singleton. Suppose w and z be two distinct points in X such that $w=\lambda u=g u$ and $z=\lambda v=g v$ for some $u, v \in C(\lambda, g)$. Then from (3.1) we obtain
$\mathrm{d}(\mathrm{w}, \mathrm{z})=\mathrm{d}(\lambda u, \lambda v)$

$$
\leq \frac{\theta}{K}\left\{\max \left\{k d(u, \mu v), k d(g u, \lambda u), k d(\lambda v, g v), \frac{d(\mu u, \lambda v)+d(\lambda u, \mu v)}{2}\right\}\right\}
$$

$$
\begin{aligned}
\mathrm{d}(\mathrm{w}, \mathrm{z}) & \leq \frac{\theta}{K}(d(\lambda u, \lambda v)) \\
& \leq \theta(d(w, z) \\
& <\mathrm{d}(\mathrm{w}, \mathrm{z})
\end{aligned}
$$

Which is a contradiction. Therefore $\mathrm{w}=\mathrm{z}$, i.e, $\mathrm{w}=\lambda u=\mu u=\lambda v=\mu v=z$. Thus,
$\operatorname{PC}(\lambda, \mu)$ is singleton, i.e., $\mathrm{w}=\lambda u=\mu u$ is the unique point of coincidence and $\operatorname{diam}(\operatorname{PC}(\lambda, \mu))=0$ from definition of D-operator pair $\lambda \mu u=\mu \lambda u$ for some points $u \in C(\lambda, \mu)$.

Now from (3.1) we have
$\mathrm{d}(\lambda \lambda u, \lambda v)=d(\lambda \lambda u, \lambda u)$

$$
\begin{aligned}
& \leq \frac{\theta}{K}\left\{\max \left\{k d(\mu \lambda u, \mu u), k d(\mu \lambda u, \lambda \lambda u), k d(\mu u, \mu u), \frac{d(\mu u, \lambda \lambda u)+d(\mu \lambda u, \lambda u)}{2}\right\}\right\} \\
& \leq \frac{\theta}{K}\left\{\max \left\{k d(\lambda \lambda u, \lambda u), k d(\lambda \lambda u, \lambda \lambda u), k d(\lambda u, \lambda u), \frac{d(\lambda u, \lambda \lambda u)+d(\lambda \lambda u, \lambda u)}{2}\right\}\right\} \\
& \leq \frac{\theta}{K}\{d(\lambda \lambda u, \lambda u\} \\
& \leq \theta(d(\lambda \lambda u, \lambda u)) \\
& \leq d(\lambda \lambda u, \lambda u)
\end{aligned}
$$

This is a contradiction. Hence $\lambda \lambda u=\mu \lambda u=\lambda u$ and therefore $\lambda, \mu h a v e$ a common fixed point. For uniqueness, suppose that $u, v \in X$, such that $\lambda u=\mu u=u$ and $\lambda v=\mu v=v$ and $u \neq v$.Then (3.1) gives,

$$
\begin{aligned}
d(u, v) & =(d(\lambda u, \lambda v)) \\
& \leq \frac{\theta}{K}\left\{\max \left\{k d(\mu u, \mu v), k d(\mu u, \mu u), k d(\lambda v, \mu v), \frac{d(\mu u, \lambda v)+d(\lambda u, \mu v)}{2}\right\}\right\} \leq \frac{\theta}{K}(d(u, v) \\
& \leq(d(u, v))
\end{aligned}
$$

Which is a contradiction. Therefore $u=v$ and hence the common fixed point of $\lambda$ and $\mu$ is unique.

## Example 3.2

Let $\mathrm{E}=R^{2}, \mathrm{P}=\{(x, y) \in E: x, y \geq 0, \subset R\}$ and define $\mathrm{d}: \mathrm{R} \times \mathrm{R} \rightarrow £$ by $\mathrm{d}(x, y)=(|x-y|, \alpha \mid x-$ $y \mid)$, where $\alpha>0$ is constant.Define $\lambda, \mu: X \rightarrow X$ by, $\lambda(x)=\left(\frac{\theta}{2 K}\right)^{\frac{1}{2}} x$ and $\mu(x)=\left[\left(\frac{\theta}{2 K}\right)^{\frac{1}{2}}+\theta^{-\frac{1}{2}}\right] x$, for $x \in X$ where $\theta \in\left(0, \frac{1}{K}\right) \quad$ and $K \geq 1$. $(\mathrm{X}, \mathrm{d})$ is a cone metric type space. $\lambda$ and $\mu$ are D operator pair satisfy condition (3.1). $\lambda$ and $\mu$ have a coincidence point 0 and unique point of coincidence which is 0 . Since $\lambda$ and $\mu$ commute at 0 , it is the unique common fixed point.

## Corollary 3.3

Let ( $\mathrm{X}, \mathrm{d}$ ) be a cone metric type space with the constant $K \geq 1$ and b a cone having a nonempty interior. Suppose that the mappings $\lambda, \mu: \mathrm{X} \rightarrow \mathrm{X}$ are such that $\lambda(\mathrm{X}) \subseteq \mu(\mathrm{X})$ and $\lambda(\mathrm{X})$ or $\mu(\mathrm{X})$ is a complete subspace of X , and that for some constant $\theta \in(0,1)$ and for every , $y \in X$, we have $\mathrm{d}(\lambda x, \lambda y) \leq \theta d(\mu x, \mu y)$. Then $\lambda$ and $\mu$ have a unique point of coincidence in X . Moreover if $\lambda$ and $\mu$ are D -operator $\mathrm{p}, \lambda$ and $\mu$ have a unique common fixed point.

## Corollary 3.4

Let ( $\mathrm{X}, \mathrm{d}$ ) be a cone metric type space with the constant $K \geq 1$ and b a cone having a nonempty interior. Suppose that the mappings $\lambda, \mu: \mathrm{X} \rightarrow \mathrm{X}$ are such that $\lambda(\mathrm{X}) \subseteq \mu(\mathrm{X})$ and $\lambda(\mathrm{X})$ or $\mu(\mathrm{X})$ is a complete subspace of X , and that for some constant $\theta \in(0,1)$ and for every $x, y \in X$, we have
$\mathrm{d}(\lambda x, \lambda y) \leq \theta\left\{\frac{d(\mu x, \lambda x)+d(\mu y, \lambda y)}{2}\right\}$
Then $\lambda$ and $\mu$ have a unique point of coincidence in X. Moreover if $\lambda$ and $\mu$ are D-operator pair, $\lambda$ and $\mu$ have a unique common fixed point.

## Corollary 3.5

Let ( $\mathrm{X}, \mathrm{d}$ ) be a cone metric type space with the constant $K \geq 1$ and $P$ a cone having a nonempty interior. Suppose that the mappings $\lambda, \mu: \mathrm{X} \rightarrow \mathrm{X}$ are such that $\lambda(\mathrm{X}) \subseteq \mu(\mathrm{X})$ and $\lambda(\mathrm{X})$ or $\mu(\mathrm{X})$ is a
complete subspace of X , and that for some constant $\theta \in(0,1)$ and for every, $y \in X$, we have

$$
\mathrm{d}(\lambda x, \lambda y) \leq \frac{\theta}{K}\left\{\frac{d(g y, \lambda x)+d(g x, \lambda y)}{2}\right\}
$$

Then $\lambda$ and $\mu$ have a unique point of coincidence in X.Moreover if $\lambda$ and $\mu$ are D-operator pair, $\lambda$ and $\mu$ have a unique common fixed point.

## Corollary 3.6

Let ( $\mathrm{X}, \mathrm{d}$ ) be a cone metric type space with the constant $K \geq 1$ and $P$ a cone having a nonempty interior. Suppose that the mappings $\lambda, \mu: \mathrm{X} \rightarrow \mathrm{X}$ are such that $\lambda(\mathrm{X}) \subseteq \mu(\mathrm{X})$ and $\lambda(\mathrm{X})$ or $\mu(\mathrm{X})$ is a complete subspace of X , and that for some constant $\theta \in(0,1)$ and for every , $y \in X$, we have

$$
\begin{aligned}
& d(\lambda x, \lambda y) \\
& \leq a d(\mu x, \mu y)+b(\max \{(d(\lambda x, \mu x), d(\lambda y, \mu y)\}) \\
& +c(\max \{(d(\mu x, \mu y), d(\mu x, \lambda x), d(\mu y, \lambda y)\}) \\
& \rightarrow(3.6)
\end{aligned}
$$

for all $x, y \in \mathrm{X}$, where $\mathrm{a}, \mathrm{b}, \mathrm{c}>0, \mathrm{a}+\mathrm{b}+\mathrm{c}=1$. Then $\lambda$ and $\mu$ have a unique point of coincidence in X.Moreover if $\lambda$ and $g$ are D-operator pair, $\lambda$ and $\mu$ have a unique common fixed point.

Proof: In the theorem (3.1) replacing the condition (3.1) by (3.4) we get the result that $\lambda$ and $\mu$ have a unique common fixed point.

## 4. APPLICATION TO BEST APPROXIMATION

## Theorem 4.1:

Let ( X, ) be a metric space of the cone type.. Suppose that $\mathrm{u} \in \mathrm{X}, \lambda$ and $\mu$ satisfy inequality (3.1) in theorem 3.1. $\lambda$ leaves $\mu$ - invariant compact subset M of a closed subspace $\mu X$ as invariant. For each $\mathrm{b} \in P_{M}(\mathrm{u})$, let $\mathrm{d}(x, \lambda b)<\mathrm{d}(x, \mu b)$ and $f b \in$ $P_{M}(\mathrm{u})$ If $\lambda$ and $\mu$ are D -operator pair, then u has a best approximation in M which is also a common fixed point of $\lambda$ and $\mu$

## Proof:

Let $\mathrm{u} \in F(\lambda) \cap F(\mu)$. Since M is a compact subset of $\mu X, \quad P_{M}(\mathrm{u}) \neq \emptyset$. To prove that $\lambda\left(P_{M}(\mathrm{u})\right) \subset$ $\mu\left(P_{M}(\mathrm{u})\right.$, assume the contrary.Then there exist $\mathrm{b} \in$ $P_{M}(\mathrm{u})$ with $\lambda b \nsubseteq \mu\left(P_{M}(\mathrm{u}).\right)$

Now, $\mathrm{d}(\mathrm{u}, \mu b)=\operatorname{dist}(\mathrm{u}, \mathrm{M})$

$$
\begin{aligned}
& <d(\mathrm{u}, \lambda b) \\
& <d(\mathrm{u}, \lambda b)
\end{aligned}
$$

As a result of Contradiction, we now have $\lambda\left(P_{M}(\mathrm{u})\right) \subset \mu\left(P_{M}(\mathrm{u})\right.$.Now $\quad f\left(P_{M}(\mathrm{u})\right)$ being a closed subset of a complete cone metric space, it is complete. Hence $P_{M}(\mathrm{u}) \cap F(\lambda) \cap F(\mu)$ is singleton.
