#### Abstract

The title compound 3,3,6,6-tetramethyl-9-(2-hydroxyphenyl)-3,4,6,7,9,10-hexahydroacridine-1,8-dione, crystallizes in the orthorhombic space group Pna $2_{1}$ with unit cell parameters: $a=13.669(5) \AA, b=14.753(5) \AA, c=10.043(5) \AA, \mathrm{Z}=8$. The crystal structure is solved by Direct methods and refined by full matrix least squares procedure to a final $R$ value of 0.0982 for 2602 observed reflections. The crystal structure is stabilized by $\mathrm{N} 1-\mathrm{H} 1 \cdots \mathrm{O} 2, \mathrm{O} 3-\mathrm{H} 3 \cdots \mathrm{O} 1$ and $\mathrm{C} 13-\mathrm{H} 13 \cdots \mathrm{O} 3$ hydrogen bonds.

## Introduction

Acridine derivatives have occupied a unique position in medicinal chemistry due to their wide range of biological application ${ }^{1}$. The acridine derivatives containing two keto functional groups at its $2^{\text {nd }}$ and $11^{\text {th }}$ position give rise to acridinediones. Acridinediones and their derivatives possess a wide range of pharmaceutical activities, including antimicrobial ${ }^{2}$, antimalarial ${ }^{3}$, antitumor ${ }^{4}$, anticancer ${ }^{5}$, antibacterial ${ }^{6}$, fungicidal ${ }^{7}$, and DNA binding properties ${ }^{8}$. These derivatives have been used in chemotherapy for the treatment of cancer ${ }^{9}$ and the treatment of cardiovascular diseases, such as angina pectoris and hypertension ${ }^{10}$. As a continuation of our research devoted to the development of acridine derivatives ${ }^{11-13}$, we herein report the synthesis and the crystal structure of the title compound.

## Experimental

## Synthesis

The synthetic route for 3,3,6,6-tetramethyl-9-(2-hydroxyphenyl)-3,4,6,7,9,10-hexahydroacridine-1,8-dione (Figure 1) is presented in Scheme 1. A mixture of dimedone ( 2 mmol ), 2-hydroxybenzaldehyde $2(1 \mathrm{mmol})$ and ammonium acetate ( 1.2 mmol ) in mixture of aqueous ethanol ( 5 ml ) was stirred at RT for 5 min . To this [CMIM] $\left[\mathrm{HSO}_{4}\right](20 \mathrm{~mol} \%)$ was added and the reaction mixture heated at $85^{\circ} \mathrm{C}$ until completion of the reaction. The progress of the reaction was monitored by TLC. After completion of the reaction, the mixture was gradually cool to room temperature and poured on ice water under stirring, solid were precipitate out. Filter the product and dried. The crude product was recrystallized from ethanol.(M.p>300 ${ }^{\circ} \mathrm{C}$, Yield: $81 \%$ ). The chemical structure of the title compound is given in Figure 1.

## Crystal structure determination and refinement

The crystallographic data are summarized in Table 1. A well-defined crystal of dimensions $0.30 \times 0.20 \times 0.20 \mathrm{~mm}^{3}$ was used for data collection on $X^{\prime}$ calibur $C C D$ area-detector diffractometer equipped with graphite monochromated $\mathrm{MoK}_{\alpha}$ radiation ( $\lambda=0.71073 \AA$ ). X-ray intensity data of 24799 reflections were collected at 293(2) K and out of these reflections 3174 were found unique. The intensities were measured by $\omega$ scan mode for $\theta$ ranges $3.60^{\circ}$ to $29.04^{\circ}$. 2602 reflections were treated as observed using $(I>2 \sigma(I))$ as a criterion. Data were corrected for Lorentz-polarization and absorption factors. The structure was solved by direct methods using SHELXS $97{ }^{14}$. All non-hydrogen atoms of the molecule were located from the best E-map. All the hydrogen atoms were geometrically fixed and allowed to ride on the corresponding non -H atoms with $\mathrm{O}-\mathrm{H}=0.82 \AA$, $\mathrm{N}-\mathrm{H}=0.86 \AA, \mathrm{C}-\mathrm{H}=0.93-0.97 \AA$ and $U_{\text {iso }}=1.2 U_{e q}(\mathrm{C})$, except for the methyl groups where $U_{\text {iso }}(\mathrm{H})=1.5 U_{\text {eq }}(\mathrm{C})$. The final refinement cycles converged to an $R$-factor of 0.0979 ( $\mathrm{w} R\left(F^{2}\right)=0.2916$ ) for the 2602 observed reflections.

Residual electron densities range from -0.308 to $0.766 \mathrm{e}^{-3}$. Atomic scattering factors were taken from International Tables for X-ray Crystallography. The geometry of the molecule was calculated using the WinGX ${ }^{15}, \mathrm{PARST}^{16}$ and PLATON ${ }^{17}$ softwares.

Crystallographic information has been deposited with CCDC-965867 to Cambridge Crystallographic Data Centre. This data can be obtained free of charge from Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data request/cif.

## Results and discussion

The molecular structure containing atomic labeling is shown in Figure 2 (ORTEP) ${ }^{18}$. The molecule consists of four rings which are labeled as ring A , ring B , ring C and ring D Figure 1. The crystallographic and refinement data of the crystal is given in Table 1.

Table 3. Geometry of Intra and Inter molecular Hydrogen bonds

| $\mathbf{D}-\mathbf{H} \ldots \mathbf{A}$ | $\mathbf{D}-\mathbf{H}(\AA)$ | $\mathbf{H} \ldots \mathbf{(}(\AA)$ | $\mathbf{D} \ldots \mathbf{A}(\AA)$ | $\mathbf{D}-\mathbf{H} . . . \mathbf{A}\left({ }^{\boldsymbol{0}}\right)$ |
| :--- | :--- | :--- | :--- | :--- |
| $\mathrm{N} 1-\mathrm{H} 1 \ldots 2^{\mathrm{i}}$ | 0.86 | 2.21 | $2.820(6)$ | 128 |
| O3-H3 ...O1 | 0.82 | 2.10 | $2.668(6)$ | 126 |
| C13-H13 ..O3 | 0.98 | 2.15 | $2.905(6)$ | 104 |

Symmetry code: (i) $-1 / 2+\mathrm{x}, 1 / 2-\mathrm{y}, \mathrm{z}$.

Some selected bond distances, bond angles and torsion angle values are given in Table 2. The structural parameters, including bond distances and bond angles, show a normal geometry ${ }^{19}$ and agree with the values observed for some related structures. ${ }^{11-13}$ The O3 atom attached with the carbon atom C19 is coplanar with the ring D, indicated by the torsion angles O3-C19-C18-C17 = 179.8(6) ${ }^{\circ}$ and $\mathrm{O} 3-\mathrm{C} 19-$ $\mathrm{C} 18-\mathrm{C} 17=178.2(5)^{\circ}$, this feature can also be seen in the related structures. ${ }^{11-13}$ The double bonds $\mathrm{C} 2=\mathrm{O} 1$ [ 1.209(7) $\AA$ ] and C11 $=\mathrm{O} 2[1.208(7) \AA$ ] agree with the corresponding distances in structures containing similar systems.

The central ring B (N1/C6/C1/C13/C12/C7) of the acridinedione moiety adopts a sofa conformation with best mirror plane passing through atoms N1 and C13 [asymmetry parameter $\Delta \mathrm{Cs}(\mathrm{N} 1)=0.46$ ]. Ring A of the title compound (C1-C6) adopts a sofa conformation with best mirror plane passing through atoms C 1 and C 4 [asymmetry parameter $\mathrm{Cs}(\mathrm{C} 1)=1.50$. Whereas ring $\mathrm{C}(\mathrm{C} 7-\mathrm{C} 12)$ adopt half-chair conformations with best two fold rotation axis bisecting the bond C9-C10 [asymmetry parameter ( $\Delta \mathrm{C}_{2}(\mathrm{C} 9-\mathrm{C} 10)=$ 3.98]. ${ }^{20}$ In the title molecule, some carbon atoms are thermally disordered. The thermal disorder could not be tackled and hence, it led to the large value of the R-factor.

In the crystal structure, intramolecular hydrogen bonds (O3-H3...O1 and C13-H13...O3) helps in stabilizing the molecule. Intermolecular interactions $\mathrm{N} 1-\mathrm{H} 1 \ldots \mathrm{O} 2$ play a crucial part in assembling the molecules in threedimensional network Table 3. Packing of the molecules in the unit cell down the c-axis is shown in Figure 3.
