**Abstract**— Let  $G = (V, E)$  be a simple graph. Let  $HD(G, i)$  be the family of hub dominating sets in  $G$  with cardinality  $i$ . Then the polynomial

$$HD(G, x) = \sum_{i=\text{hd}(G)}^{|V(G)|} \text{hd}(G, i)x^i$$

is called the hub domination polynomial of  $G$  where  $\text{hd}(G, i)$  is the number of hub dominating sets of  $G$  with cardinality  $i$  and  $\text{hd}(G)$  is the hub domination number of  $G$ . Let  $K_{2,n}$  denotes the complete bipartite graph with  $n + 2$  vertices and  $HD(K_{2,n}, i)$  denotes the family of hub dominating sets of  $K_{2,n}$  with cardinality  $i$ . Then, the polynomial,

$$HD(K_{2,n}, x) = \sum_{i=\text{hd}(K_{2,n})}^{|V(K_{2,n})|} \text{hd}(K_{2,n}, i)x^i$$

is called the hub domination polynomial of  $K_{2,n}$  where  $\text{hd}(K_{2,n}, i)$  is the number of hub dominating sets of  $K_{2,n}$  with cardinality  $i$  and  $\text{hd}(K_{2,n})$  is the hub domination number of  $K_{2,n}$ .

In this paper, we obtain a recursive formula for  $\text{hd}(K_{2,n}, i)$ . Using this recursive formula, we construct the hub domination polynomial of  $K_{2,n}$  as,

$$HD(K_{2,n}, x) = \sum_{i=2}^{n+2} \text{hd}(K_{2,n}, i)x^i$$

where  $\text{hd}(K_{2,n}, i)$  is the number of hub dominating sets of  $K_{2,n}$  with cardinality  $i$  and some of the properties of this polynomial also have been studied.

## INTRODUCTION

A graph  $G = (V, E)$  is called a bipartite graph if its vertices  $V$  can be partitioned into two subsets  $V_1$  and  $V_2$  such that each edge of  $G$  connects a vertex of  $V_1$  to a vertex of  $V_2$ . If  $G$  contains every edge joining a vertex of  $V_1$  and a vertex of  $V_2$  then  $G$  is called a complete bipartite graph. It is denoted by  $K_{m,n}$ , where  $m$  and  $n$  are the number of vertices in  $V_1$  and  $V_2$  respectively.

A set  $D \subseteq V$  is a dominating set of  $G$  if  $N[D] = V$  or equivalently, every vertex in  $V - D$  is adjacent to atleast one vertex in  $D$ . The domination number of a graph  $G$  is defined as the minimum cardinality taken over all the dominating sets  $D$  of vertices in  $G$  and is denoted by  $\gamma(G)$ .

The families of hub-dominating sets of  $K_{2,n}$  are built using a recursive method in the following part. Using the findings from section II, we investigate the hub domination equations of the full bipartite graph  $K_{2,n}$  in section III. For the typical combination  $n$  to  $i$ , we use  $\binom{n}{i}$ . Additionally, we use  $[n]$  to indicate the set  $\{1, 2, \dots, n\}$

### I. HUB DOMINATING SETS OF THE COMPLETE BIPARTITE GRAPH $K_{2,n}$

In this section, we list the hub domination number and some of the characteristics of the hub dominating sets of the full bipartite graph  $K_{2,n}$ . We use  $V(K_{2,n}) = \{v_1, v_2, v_3, \dots, v_{n+1}, v_{n+2}\}$  and  $E(K_{2,n}) = \{(v_1, v_3), (v_1, v_4), \dots, (v_1, v_{n+1}), (v_1, v_{n+2}), (v_2, v_3), (v_2, v_4), \dots, (v_2, v_{n+1}), (v_2, v_{n+2})\}$  throughout this paper.

#### **Definition 2.1**

Let  $G$  be a simple graph of order  $n$  with no isolated vertices. A set  $D \subseteq V$  is said to be a hub dominating set if every vertex in  $V - D$  is adjacent to atleast one vertex in  $D$  and every pair of vertices in  $V - D$  has a path in  $G$  such that all the internal vertices of the path are in  $D$ . The hub dominaton number of a graph  $G$  is defined as the minimum cardinality taken over all the dominating sets  $D$  of vertices in  $G$  and is denoted by  $\text{hd}(G)$ .

#### **Lemma 2.2**

For all  $n \in \mathbb{Z}^+$ ,  $\binom{n}{i} = 0$  if  $i > n$  or  $i < 0$ .

### Theorem 2.3

Let  $K_{2,n}$  be the complete bipartite graph with  $n + 2$  vertices. Then,

$$hd(K_{2,n}, i) = \begin{cases} \binom{n+2}{i} - \binom{n}{i} & \text{when } 2 \leq i \leq n+2 \text{ and } i \neq n \\ \binom{n+2}{i} - \binom{n}{i} + 1 & \text{when } i = n \end{cases}$$

#### Proof:

Let  $K_{2,n}$  be the complete bipartite graph with  $n + 2$  vertices and  $n \geq 3$ . Let the partite sets of  $K_{2,n}$  be  $V_1 = \{v_1, v_2\}$  and  $V_2 = \{v_3, \dots, v_n, v_{n+1}, v_{n+2}\}$ . Since  $K_{2,n}$  contains  $n + 2$  vertices, the number of subsets of  $K_{2,n}$  with cardinality  $i$  is  $\binom{n+2}{i}$ . Each time  $\binom{n}{i}$  number of subsets of  $K_{2,n}$  with cardinality  $i$  are not hub dominating sets. Hence,  $K_{2,n}$  contains  $\binom{n+2}{i} - \binom{n}{i}$  number of subsets of hub dominating sets with cardinality  $i$ . When  $i = n$ , the subgraph induced by the vertex set  $\{v_3, \dots, v_n, v_{n+1}, v_{n+2}\}$  is also a hub dominating set. Therefore, one more set is hub dominating set when the cardinality is  $n$ . Therefore,  $K_{2,n}$  contains  $\binom{n+2}{i} - \binom{n}{i} + 1$  number of subsets of hub dominating sets with cardinality  $n$ .

$$\text{Hence, } hd(K_{2,n}, i) = \begin{cases} \binom{n+2}{i} - \binom{n}{i} & \text{when } 2 \leq i \leq n+2 \text{ and } i \neq n \\ \binom{n+2}{i} - \binom{n}{i} + 1 & \text{when } i = n \end{cases}$$

### Theorem 2.4

Let  $K_{2,n}$  be the complete bipartite graph with  $n + 2$  vertices. Then,

- (i)  $hd(K_{2,n}, i) = hd(K_{2,n-1}, i) + 2$  if  $i = 2$
- (ii)  $hd(K_{2,n}, i) = hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1) - 1$  if  $i = n-1$
- (iii)  $hd(K_{2,n}, i) = hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1)$

for all  $3 \leq i \leq n+2$  and  $i \neq n-1$

#### Proof:

- (i) When  $i = 2$

$$\begin{aligned}
hd(K_{2,n}, 2) &= \binom{n+2}{2} - \binom{n}{2} \\
&= \frac{(n+2)(n+1)}{2} - \left[ \frac{n(n-1)}{2} \right] \\
&= \frac{1}{2} [(n^2 + 3n + 2) - (n^2 - n)] \\
&= \frac{1}{2} [n^2 + 3n + 2 - n^2 + n] \\
&= \frac{1}{2} [4n + 2]
\end{aligned}$$

$$hd(K_{2,n}, 2) = 2n + 1$$

$$\begin{aligned}
\text{Consider, } hd(K_{2,n-1}, 2) &= \binom{n+1}{2} - \binom{n-1}{2} \\
&= \frac{(n+1)n}{2} - \left[ \frac{(n-1)(n-2)}{2} \right] \\
&= \frac{1}{2} [(n^2 + n) - (n^2 - 3n + 2)] \\
&= \frac{1}{2} [n^2 + n - n^2 + 3n - 2] \\
&= \frac{1}{2} [4n - 2] \\
&= 2n - 1 \\
&= 2n + 1 - 2
\end{aligned}$$

$$hd(K_{2,n-1}, 2) = hd(K_{2,n}, 2) - 2$$

$$\text{Therefore, } hd(K_{2,n}, 2) = hd(K_{2,n-1}, 2) + 2$$

$$\text{Hence, } hd(K_{2,n}, i) = hd(K_{2,n-1}, i) + 2 \text{ if } i = 2$$

(ii) When  $i = n - 1$

By Theorem 2.3,

$$\text{we have, } hd(K_{2,n}, n - 1) = \binom{n+2}{n-1} - \binom{n}{n-1}$$

$$hd(K_{2,n-1}, n - 1) = \binom{n+1}{n-1} - \binom{n-1}{n-1} + 1 \text{ and}$$

$$hd(K_{2,n-1}, n-2) = \binom{n+1}{n-2} - \binom{n-1}{n-2}$$

Consider,

$$\begin{aligned} hd(K_{2,n-1}, n-1) + hd(K_{2,n-1}, n-2) &= \binom{n+1}{n-1} - \binom{n-1}{n-1} + 1 + \binom{n+1}{n-2} \\ &\quad - \binom{n-1}{n-2} \\ &= \left[ \binom{n+1}{n-1} + \binom{n+1}{n-2} \right] + 1 - \left[ \binom{n-1}{n-1} + \binom{n-1}{n-2} \right] \\ &= \binom{n+2}{n-1} - \binom{n}{n-1} + 1 \\ &= hd(K_{2,n}, n-1) + 1 \end{aligned}$$

$$hd(K_{2,n-1}, n-1) + hd(K_{2,n-1}, n-2) = hd(K_{2,n}, n-1) + 1$$

$$\text{Therefore, } hd(K_{2,n}, n-1) = hd(K_{2,n-1}, n-1) - hd(K_{2,n-1}, n-2) - 1$$

$$\text{Hence, } hd(K_{2,n}, i) = hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1) - 1 \text{ if } i = n-1$$

(iii) By Theorem 2.3, we have,

$$hd(K_{2,n}, i) = \binom{n+2}{i} - \binom{n}{i} \text{ for all } 3 \leq i \leq n+2 \text{ and } i \neq n-1$$

$$hd(K_{2,n-1}, i) = \binom{n+1}{i} - \binom{n-1}{i}$$

$$\text{and } hd(K_{2,n-1}, i-1) = \binom{n+1}{i-1} - \binom{n-1}{i-1}$$

Consider,

$$\begin{aligned} hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1) &= \binom{n+1}{i} - \binom{n-1}{i} + \binom{n+1}{i-1} - \binom{n-1}{i-1} \\ &= \left[ \binom{n+1}{i} + \binom{n+1}{i-1} \right] - \left[ \binom{n-1}{i} + \binom{n-1}{i-1} \right] \\ &= \binom{n+2}{i} - \binom{n}{i} \end{aligned}$$

$$hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1) = hd(K_{2,n}, i)$$

Therefore,

$$hd(K_{2,n}, i) = hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1) \text{ for all } 3 \leq i \leq n+2 \text{ and } i \neq n-1$$

## II. HUB DOMINATION POLYNOMIALS OF THE COMPLETE BIPARTITE GRAPH $K_{2,n}$

### **Definition 3.1**

Let  $K_{2,n}$  denotes the complete bipartite graph with  $n+2$  vertices and  $HD(K_{2,n}, i)$  denotes the family of hub dominating sets of  $K_{2,n}$  with cardinality  $i$ . Then, the polynomial,

$$HD(K_{2,n}, x) = \sum_{i=hd(k_{2,n})}^{|V(K_{2,n})|} hd(K_{2,n}, i)x^i$$

is called the hub domination polynomial of  $K_{2,n}$  where  $hd(K_{2,n}, i)$  is the number of hub dominating sets of  $K_{2,n}$  with cardinality  $i$  and  $hd(k_{2,n})$  is the hub domination number of  $K_{2,n}$ .

### **Theorem 3.2**

Let  $K_{2,n}$  be the complete bipartite graph with  $n+2$  vertices. Then, the hub domination polynomial of  $K_{2,n}$  is  $HD(K_{2,n}, x) = (1+x)HD(K_{2,n-1}, x) + 2x^2 - x^{n-1}$

with initial value  $HD(K_{2,3}, x) = 7x^2 + 10x^3 + 5x^4 + x^5$ .

### **Proof:**

From the definition of hub domination polynomial, we have,

$$\begin{aligned} HD(K_{2,n}, x) &= \sum_{i=2}^{n+2} hd(K_{2,n}, i)x^i \\ &= hd(K_{2,n}, 2)x^2 + hd(K_{2,n}, n-1)x^{n-1} \\ &\quad + \sum_{\substack{i=3 \\ i \neq n-1}}^{n+2} hd(K_{2,n}, i)x^i \\ &= [hd(K_{2,n-1}, 2) + 2]x^2 + [hd(K_{2,n-1}, n-1)] \end{aligned}$$

$$\begin{aligned}
& +hd(K_{2,n-1}, n-2) - 1]x^{n-1} \\
& + \sum_{\substack{i=3 \\ i \neq n-1}}^{n+2} [hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1)]x^i \\
& = hd(K_{2,n-1}, 2)x^2 + 2x^2 + [hd(K_{2,n-1}, n-1) + hd(K_{2,n-1}, n-2)]x^{n-1} \\
& - x^{n-1} + \sum_{\substack{i=3 \\ i \neq n-1}}^{n+2} [hd(K_{2,n-1}, i) + hd(K_{2,n-1}, i-1)]x^i \\
& = \sum_{i=2}^{n+2} hd(K_{2,n-1}, i)x^i + \sum_{i=2}^{n+2} hd(K_{2,n-1}, i-1)x^i + 2x^2 - x^{n-1} \\
& = \sum_{i=2}^{n+2} hd(K_{2,n-1}, i)x^i + x \sum_{i=2}^{n+2} hd(K_{2,n-1}, i-1)x^{i-1} + 2x^2 - x^{n-1} \\
& = HD(K_{2,n-1}, x) + xHD(K_{2,n-1}, x) + 2x^2 - x^{n-1}
\end{aligned}$$

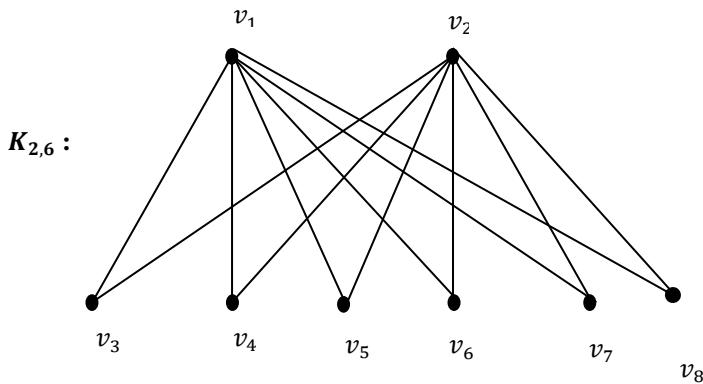

$HD(K_{2,n}, x) = (1+x)HD(K_{2,n-1}, x) + 2x^2 - x^{n-1}$

Hence,  $HD(K_{2,n}, x) = (1+x)HD(K_{2,n-1}, x) + 2x^2 - x^{n-1}$

with initial value  $HD(K_{2,3}, x) = 7x^2 + 10x^3 + 5x^4 + x^5$ .

### Example 3.3

Consider the complete bipartite graph  $K_{2,6}$  with order 8 given in Figure 1.

**Figure 1**

$$HD(K_{2,5}, x) = 11x^2 + 25x^3 + 30x^4 + 21x^5 + 7x^6 + x^7$$

By Theorem 3.2, we have,

$$\begin{aligned}
HD(K_{2,6}, x) &= (1+x)HD(K_{2,5}, x) + 2x^2 - x^5 \\
&= (1+x)(11x^2 + 25x^3 + 30x^4 + 21x^5 + 7x^6 + x^7) + 2x^2 - x^5 \\
&= 11x^2 + 25x^3 + 30x^4 + 21x^5 + 7x^6 + x^7 + 11x^3 + 25x^4 + 30x^5 \\
&\quad + 21x^6 + 7x^7 + x^8 + 2x^2 - x^5 \\
HD(K_{2,6}, x) &= 13x^2 + 36x^3 + 55x^4 + 50x^5 + 28x^6 + 8x^7 + x^8
\end{aligned}$$

### Theorem 3.4

Let  $K_{2,n}$  be the complete bipartite graph with  $n \geq 3$ . Then

$$HD(K_{2,n}, x) = \sum_{i=2}^{n+2} \binom{n+2}{i} x^i - \sum_{i=2}^{n+2} \binom{n}{i} x^i + x^n.$$

#### Proof:

Proof follows from Theorem 2.3, Theorem 2.4 and the definition of Hub Domination Polynomial.

We obtain  $hd(K_{2,n}, i)$  for  $3 \leq n \leq 10$  and  $2 \leq i \leq 12$  as shown in Table 1.

**Table 1**

**$HD(k_{2,n}, i)$ , Hub Dominating Sets of  $K_{2,n}$  with cardinality  $i$ .**

| $\begin{matrix} i \\ \diagdown \\ n \end{matrix}$ | 2  | 3   | 4   | 5   | 6   | 7   | 8   | 9   | 10 | 11 | 12 |
|---|----|-----|-----|-----|-----|-----|-----|-----|----|----|----|
| $K_{2,3}$   | 7  | 10  | 5   | 1   |     |     |     |     |    |    |    |
| $K_{2,4}$   | 9  | 16  | 15  | 6   | 1   |     |     |     |    |    |    |
| $K_{2,5}$   | 11 | 25  | 30  | 21  | 7   | 1   |     |     |    |    |    |
| $K_{2,6}$   | 13 | 36  | 55  | 50  | 28  | 8   | 1   |     |    |    |    |
| $K_{2,7}$   | 15 | 49  | 91  | 105 | 77  | 36  | 9   | 1   |    |    |    |
| $K_{2,8}$   | 17 | 64  | 140 | 196 | 182 | 112 | 45  | 10  | 1  |    |    |
| $K_{2,9}$   | 19 | 81  | 204 | 336 | 378 | 294 | 156 | 55  | 11 | 1  |    |
| $K_{2,10}$  | 21 | 100 | 285 | 540 | 714 | 672 | 450 | 210 | 66 | 12 | 1  |

In the following Theorem, we obtain some properties of  $HD(K_{2,n}, i)$ .

### Theorem 3.5

The following properties hold for the coefficients of  $HD(K_{2,n}, i)$  for all  $n$ .

- (i)  $hd(K_{2,n}, 2) = 2n + 1$ , for every  $n \geq 3$ .
- (ii)  $hd(K_{2,n}, n+2) = [n+2]$ , for every  $n \geq 3$ .
- (iii)  $hd(K_{2,n}, n+1) = [n+2]$ , for every  $n \geq 3$ .
- (iv)  $hd(K_{2,n}, n) = \frac{1}{2}(n^2 + 3n + 2)$ , for every  $n \geq 3$ .
- (v)  $hd(K_{2,n}, n-1) = \frac{1}{6}(n^3 + 3n^2 - 4n)$ , for every  $n \geq 4$ .
- (vi)  $hd(K_{2,n}, n-2) = \frac{1}{24}(n^4 + 2n^3 - 13n^2 + 10n)$ , for every  $n \geq 4$ .

#### Proof

(i) From Theorem 2.3, we have,

$$\begin{aligned} hd(K_{2,n}, 2) &= \binom{n+2}{2} - \binom{n}{2} \\ &= \frac{(n+2)(n+1)}{2} - \left[ \frac{n(n-1)}{2} \right] \\ &= \frac{1}{2}[(n^2 + 3n + 2) - (n^2 - n)] \\ &= \frac{1}{2}[n^2 + 3n + 2 - n^2 + n] \\ &= \frac{1}{2}[4n + 2] \\ &= 2n + 1 \end{aligned}$$

Therefore  $hd(K_{2,n}, 2) = 2n + 1$ , for every  $n \geq 3$ .

(ii) Since,  $HD(K_{2,n}, n+2) = [n+2]$ , we have the result.

(iii) Since,  $HD(K_{2,n}, n+1) = \{[n+2] - x/x \in [n+2]\}$ ,

we have the result.

(iv) To prove  $hd(K_{2,n}, n) = \frac{1}{2}(n^2 + 3n + 2)$ , for every  $n \geq 3$ ,

we apply induction on  $n$ .

When  $n = 3$ ,

$$\text{L.H.S} = \text{hd}(K_{2,3}, 3) = 10 \text{ (from the Table 1)}$$

$$\text{R.H.S} = \frac{1}{2}(3^2 + 9 + 2) = 10$$

Therefore, the result is true for  $n = 3$ .

Now, suppose that the result is true for all numbers less than  $n$  and we prove it for  $n$ .

$$\begin{aligned}\text{hd}(K_{2,n}, n) &= \text{hd}(K_{2,n-1}, n) + \text{hd}(K_{2,n-1}, n-1) \\&= (n-1) + 2 + \frac{1}{2}[(n-1)^2 + 3(n-1) + 2] \\&= n + 1 + \frac{1}{2}(n^2 - 2n + 1 + 3n - 3 + 2) \\&= \frac{1}{2}(2n + 2 + n^2 + n) \\&= \frac{1}{2}(n^2 + 3n + 2)\end{aligned}$$

Hence, the result is true for all  $n$ .

(v) To prove  $\text{hd}(K_{2,n}, n-1) = \frac{1}{6}(n^3 + 3n^2 - 4n)$ , for every  $n \geq 4$ ,

we apply induction on  $n$ .

When  $n = 4$ ,

$$\text{L.H.S} = \text{hd}(K_{2,4}, 3) = 16 \text{ (from the Table 1)}$$

$$\begin{aligned}\text{R.H.S} &= \frac{1}{6}[4^3 + 3(4)^2 - 4(4)] \\&= \frac{1}{6}(64 + 48 - 16) = 16\end{aligned}$$

Therefore, the result is true for  $n = 4$ .

Now, suppose that the result is true for all numbers less than  $n$  and we prove it for  $n$ .

$$\begin{aligned}\text{hd}(K_{2,n}, n-1) &= \text{hd}(K_{2,n-1}, n-1) + \text{hd}(K_{2,n-1}, n-2) - 1 \\&= \frac{1}{2}[(n-1)^2 + 3(n-1) + 2]\end{aligned}$$

$$\begin{aligned}
& + \frac{1}{6}[(n-1)^3 + 3(n-1)^2 - 4(n-1)] - 1 \\
& = \frac{1}{2}[n^2 + n] + \frac{1}{6}[n^3 - 7n + 6] - 1 \\
& = \frac{1}{6}[3n^2 + 3n + n^3 - 7n + 6] - 1 \\
hd(K_{2,n}, n-1) & = \frac{1}{6}(n^3 + 3n^2 - 4n)
\end{aligned}$$

Hence, the result is true for all  $n$ .

(vi) To prove  $hd(K_{2,n}, n-2) = \frac{1}{24}(n^4 + 2n^3 - 13n^2 + 10n)$ , for every  $n \geq 4$ .

we apply induction on  $n$ .

When  $n = 4$ ,

$$\begin{aligned}
\text{L.H.S} & = hd(K_{2,4}, 2) = 9 \text{ (from the Table)} \\
\text{R.H.S} & = \frac{1}{24}[4^4 + 2(4)^3 - 13(4)^2 + 10(4)] \\
& = \frac{1}{24}[256 + 128 - 208 + 40] = 9
\end{aligned}$$

Therefore, the result is true for  $n = 4$ .

Now, suppose that the result is true for all numbers less than  $n$  and we prove it for  $n$

$$\begin{aligned}
hd(K_{2,n}, n-2) & = hd(K_{2,n-1}, n-2) + hd(K_{2,n-1}, n-3) \\
& = \frac{1}{6}[(n-1)^3 + 3(n-1)^2 - 4(n-1)] \\
& \quad + \frac{1}{24}[(n-1)^4 + 2(n-1)^3 - 13(n-1)^2 + 10(n-1)] \\
& = \frac{1}{6}[n^3 - 7n + 6] + \frac{1}{24}[n^4 - 2n^3 - 13n^2 + 38n - 24] \\
& = \frac{1}{24}[4n^3 - 28n + 24 + n^4 - 2n^3 - 13n^2 + 38n - 24] \\
hd(K_{2,n}, n-2) & = \frac{1}{24}[n^4 + 2n^3 - 13n^2 + 10n]
\end{aligned}$$

Hence, the result is true for all  $n$ .

## CONCLUSION

This article deduces the hub domination polynomials of the complete bipartite graph  $K_{2,n}$  by identifying its hub dominating sets. We can also use cardinality  $i$  to characterise the hub dominating sets. Any complete bipartite graph  $K_{m,n}$  can be used as a generalisation of this research, and some intriguing properties can be discovered.
