#### Abstract

Nicardipine is a calcium channel blockers which blocks the influx of calcium ions into smooth muscles and blocking the influx of calcium ions which results in a vasodilation and decrease the oxygen consumption and reduce the cardiac load. Nicardipine is used in the treatment of hypertension and angina pectoris and also used for management of heart failure. Aim of the present work is to formulation and evaluation of mucoadhesive tablets of Nicardipine using natural binders such as Gum tragacanth and Guar Gum to reduce the first pass metabolism and frequency of administration. HPMC was used as polymer Gumtragacanth and Guar Gum used as swelling agent as well as control release polymer. The tablets were formulated by direct compression method and were then evaluated for various pre-compression and post compression parameters such as hardness, friability, thickness, weight uniformity, drug content, drug release, swelling study, in-vitro drug release and in-vitro mucoadhesive strength. FTIR showed no interaction between drug and polymers. The optimized formula consisted of Nicardipine (30mg), Chitosan Gum Tragacanth and gaur gum, showed a maximum drug release after 12 hrs,maximum swelling was attained in 8 hrs and the highest mucoadhesive strength. Results indicate that release from optimized formulation of mucoadhesive buccal tablets of Nicardipine fits zero order kinetics and can bypass the first pass metabolism and enhance the release of drug for extended periodoftime.

Keywords: Nicardipine, Mucoadhesive Tablets, GuarGum, Chitosan, Mucoadhesive Strength Etc.

## 1. INTRODUCTION

Oral controlled drug delivery's primary goal is to provide tablets for longer periods of time in order to achieve greater bioavailability, which should be foreseeable and repeatable. However, it is challenging because of a variety of physiological difficulties, such as variations in the gastric emptying process, a small absorption window, and gastrointestinal stability issues ${ }^{1}$. Unique strategies to keep the dosage form in the stomach have been presented as a solution to those issues. These include delayed gastric emptying devices such as floating systems, mucoadhesive or bioadhesive systems ${ }^{2}$, swelling and increasing systems ${ }^{3,4}$ and rising systems ${ }^{5}$. A mucus membrane's tendency to "stick" to an organic or synthetic material, which causes the fabric to adhere to the tissue for an extended period ofa mucus membrane's tendency to "stick" to an organic or synthetic material, which causes the fabric to adhere to the tissue for an extended period of time, is known as mucoadhesion or bioadhesion Oral controlled drug delivery's main goal is to provide pills for long-term use. A cloth needs to interact with the mucus, a highly hydrated, viscous anionic hydrogel layer defending the mucosa, in order to become bioadhesive.

The mucoadhesive coaching principle offers a straightforward, practical method that is very useful for extending a dose form's duration in the stomach, improving the drug's oral bioavailability. Most mucoadhesive substances are either manufactured, natural, hydrophilic, or insoluble in water polymers that have the ability to make many hydrogen bonds because they include hydroxyl, carboxyl, or sulphate functional groups. ${ }^{6}$

Binders are salespeople who provide the granules cohesion. This ensures that the tablet willbe unaffected by compression. In order to achieve various tablet mechanical electricity and drug release dwellings for specific pharmaceutical purposes, specific binding retailers might be helpful. Herbal binders such particular starch, gums, mucilages, and dried fruit have the ability to bind in addition to having other properties like filler and disintegrant, and they are safer and less expensive than synthetic polymers like PVP. ${ }^{7}$

Nicardipine belongs to the group of drugs known as calcium channel blockers. By allowing the blood arteries to relax, it decreases blood pressure and lessens the workload on the heart's pumping action. By boosting the flow of blood and oxygen to the heart, it alleviates chest pain. The bioavailability of nicardipine was between 15 and 45 percent at doses between 10 and $40 \mathrm{mg} .{ }^{8}$

Nicardipine is prescribed to treat excessive blood pressure and to manage angina (chest pain). The bioavailability is set to be between 15 and $40 \%$, while the removal half-life is fixed at five hours. This is as a result of the drug's current mechanism, which skips liver and intestinal wall metabolism first ${ }^{7}$. Because it has a plentiful blood supply and is quite porous, the buccal mucosa is an appealing route for the systemic delivery of many pills ${ }^{8,9}$. Compared to conventional methods of systemic medication administration, the mucoadhesive buccal drug delivery system has many advantages ${ }^{10}$.

## 2. MATERIALS ANDMETHODS

### 2.1 Materials

Dhamtech Pharma provides nicardipine. Chitosan and guar gum are both available from ajanta pharma Aurangabad as well as Encore health pvt.Ltd. The additional chemicals and reagents that were employed were all analytical reagent grade.

### 2.2 PreparationofMucoadhesive TabletsofNicardipine

Nicardipine mucoadhesive tablets were made utilising the direct compression method and the polymers chitosan, HPMC K4M, sodium alginate, gaur gum, and gum acacia. According to the batch formula (Table), all of the constituents, including the medication, polymer, and excipients, were precisely weighed. With the use of a stainless steel spatula, the medication and all the other materials aside from the lubricants were transferred to a sheet of butter paper. The ingredients were then combined in descending weight order and blended for 10 minutes in an expanded polyethylene pouch. The lubricant was added and well mixed for two minutes after the ingredients had been thoroughly mixed. On a single stroke tablet punching machine, the prepared blend of each formulation was pre-compressed using various punches ( 8 mm and 9 mm ) in accordance with their weights (Rimek) to create a mucoadhesive tablet, apply pressure of 0.5 tonnes and turret speed of 2 rpm .

## 3. EvaluationTests

### 3.1 Characterization of mucoadhesive tablets of Nicardipine:

1. Polymer drug interaction study:

The drug-polymer and polymer-polymer interplay became studied by way of FTIR spectrometer the use of Shimadzu 8400-S, Japan. percentage ( $\mathrm{w} / \mathrm{w}$ ) of the pattern with recognize to a potassium bromide disc changed into combined with dry KBr . The combination changed into ground into a excellent powder the use of an agate mortar and then compressed into a KBr discs in a hydraulic press at a stress of 10000 psi. Each KBr disc turned into scanned 16 times at $2 \mathrm{~mm} / \mathrm{sec}$ at a resolution of $4 \mathrm{~cm}-1$ the usage of cosine apodization. The characteristic peaks had been recorded.

## I. Evaluation of mucoadhesive tablets of Nicardipine:

1) Hardnesstest ${ }^{11}$ :

Using a Monsanto Hardness tester, the tablets' hardness was assessed. $\mathrm{Kg} / \mathrm{cm} 2$ is the unit of measurement. From each formulation, three tablets were chosen at random, and the mean and standard deviation values were computed.

## 2) Thickness ${ }^{11}$ :

Sing a Vernier Capillar and three randomly chosen tablets from each recipe, the thickness was measured in mm .

## 3) Friabilitytest ${ }^{11}$ :

When exposed to mechanical shock or attrition, it is a condition where tablet surfaces are harmed and/or show signs of lamination or fracture. Using the Roche Friabilator and the IP friability technique, the friability of the tablet was ascertained. It's stated as a percentage (\%). Twenty pills were placed in the friabilator after being originally weighed (Winitial). The friabilator was run up to 100 revolutions per minute or at 25 rpm for 4 minutes. Again weighing the tablets was done (Wfinal). Tablets with less than $1 \%$ friability are acceptable.

## 4) Uniformity ofweight ${ }^{12,13}$ :

The weight variation test was carried out in accordance with IP protocol. Dusting off each tablet and setting it in an electronic balance allowed us to determine the weight (in mg ) of each of the 20 unique tablets that were randomly chosen from each formulation. The sample mean and $\%$ deviation were calculated using the weight data from the pills.

## 5) Uniformity of drugcontent ${ }^{12,13}$ :

Five pills were crushed in a glass mortar to a powder, and 50 mg of the resulting powder was added to a 100 ml conical flask with a stopper. The drug was extracted using 40 ml of methanol and vigorous shaking for an hour at 100 revolutions per minute on a mechanical gyratory shaker. After 30 minutes of heating on a water bath with periodic shaking, the mixture was filtered through cotton wool into a 50 ml volumetric flask. The filtrate was then diluted appropriately and the absorbance at 235 nm was measured in comparison to a blank (methanol).

## 6) SwellingIndex ${ }^{15}$ :

In phosphate buffer pH 6.8 , the swelling index of the mucoadhesive pill was assessed. The tablet's original weight was calculated, and it was then put in a petridish with 6 ml of phosphate buffer, pH 6.8 , and incubated at $37{ }^{\circ} \mathrm{C}$. At various time intervals ( $0.5,1.0,2.0,3.0,4.0,5.0,6.0,7.0$, and 8.0 h ), the tablet was withdrawn, blotted with filter paper, and reweighed (W2). The formula below is used to compute the swelling index:

Swelling index $=100\left(\mathrm{~W}_{2}-\mathrm{W}_{1}\right) / \mathrm{W}_{1}$.
Where, $\mathrm{W}_{1}=$ Initial weight of the tablet.
$\mathrm{W}_{2}=$ Final weight of tablet.

## 7) Mucoadhesionstrength ${ }^{19}$ :

Ex vivo residence time was used to determine the adhesive strength of a mucilage tablet, and the apparatus
was modified from a USP dissolving test setup. After being secured on a glass slab for 30 seconds, the test and control mucilage tablets ( 200 mg ) were applied to the excised goat mucosa and submerged in a jar of dissolution equipment containing 750 mL of phosphate buffer, pH 6.8 at $37^{\circ} \mathrm{C}$. The USP dissolving equipment' paddle type II device was set at a distance of 5 cm above the tablet and revolved at a speed of 25 rpm. It was noted when the mucosa completely eroded or detached.

## 8) Short Term Stabilitystudies ${ }^{22}$ :

The promising mucoadhesive Nicardipine tablets were subjected to a short-term stability investigation over three months (90 days) at a temperature of $40.2^{\circ} \mathrm{C}$. A sufficient number of tablets (10) were packed in amber-colored screw-cap bottles and individually wrapped in aluminium foil before being maintained in a stability chamber for three months. Each month, samples were collected for analysis of the drug content, surface pH , and in vitro drug release studies.

## 4. RESULTS AND DISCUSSION:

### 4.1 Melting pointdetermination

Melting point of Nicardipine was obained in the range of $171-172^{\circ} \mathrm{C}$. The standard melting point value of Nicardipine is $172^{\circ} \mathrm{C}$.

### 4.2 Drug-polymer interaction studies byFT-IR

Fig 1: IR Spectrum of Nicardipine.
Fig 3: FTIR Spectra of Nicardipine:MCC.

Fig 2: FTIR Spectra of Nicardipine:HPMC.
Fig 4: FTIR Spectra of Nicardipine:Chitosan.

This study show that all drug and excipient are compatible with each other. There is no impurities or interaction are seen in Drug and excipients.

### 4.3 Evaluation of powder properties (Pre-compression parameters)

Table No.2.bulk density and tapped density of the powder formulation

| S.No of <br> Formula <br> tion | Bulk Density | Tapped <br> Density | Angle of <br> Repose | Hauser's <br> Ratio | Carr's <br> Index |
| :--- | :--- | :--- | :--- | :--- | :--- |
| F1 | $0.4477 \pm 0.005$ | $0.5357 \pm 0.008$ | $24^{\circ} .47 \pm 0.013$ | $1.1965 \pm 0.017$ | 16.42 |
| F2 | $0.4580 \pm 0.006$ | $0.5357 \pm 0.008$ | $23^{\circ} .98 \pm 0.149$ | $1.1696 \pm 0.016$ | 14.50 |
| F3 | $0.4284 \pm 0.005$ | $0.4918 \pm 0.007$ | $22^{\circ} .83 \pm 0.396$ | $1.1479 \pm 0.002$ | 12.89 |
| F4 | $0.4511 \pm 0.005$ | $0.5218 \pm 0.077$ | $22^{\circ} .53 \pm 0.334$ | $1.1567 \pm 0.002$ | 13.54 |
| F5 | $0.4313 \pm 0.005$ | $0.4839 \pm 0.006$ | $21^{\circ} .69 \pm 0.439$ | $1.1219 \pm 0.025$ | 10.87 |
| F6 | $0.4285 \pm 0.005$ | $0.4979 \pm 0.006$ | $21^{\circ} .31 \pm 0.234$ | $1.1619 \pm 0.017$ | 13.93 |
| F7 | $0.4651 \pm 0.006$ | $0.5313 \pm 0.007$ | $20^{\circ} .43 \pm 0.135$ | $1.1423 \pm 0.032$ | 12.46 |
| F8 | $0.4285 \pm 0.005$ | $0.4763 \pm 0.011$ | $20^{\circ} .93 \pm 0.313$ | $1.1115 \pm 0.030$ | 10.03 |
| F9 | $0.4175 \pm 0.005$ | $0.4819 \pm 0.005$ | $21^{\circ} .69 \pm 0.439$ | $1.1429 \pm 0.002$ | 11.87 |

The values obtained lies within the acceptable range. All the parameters are within rage so it is suitable for direct compression method.

### 4.4 Post compressionparameters:

### 4.4.1 Shape of thetablets:

Visually inspection of prepared all tablets were done. The shapes of the tablets were found to be good.

### 4.4.2 Friability(F)

All of the formulations' friability levels were under $1 \%$, which shows that they were all within the permitted ranges. The tablet has good mechanical strength, according to the friability test results. The range of the friability value is 0.67 to 0.92 .

### 4.4.3 Hardness:

The results were tabulated in Table no 8.8. The hardness value ranges from $4.97 \pm 0.032$ to $6.93 \pm 0.133 \mathrm{~kg} / \mathrm{cm}^{2}$

### 4.4.4 Weightvariation:

The data were pretty uniformly acquired. The dosages of the pills range from 198.9 mg to 199.8 mg . Since the weight fluctuation was less than $8.5 \%$ of the weight allowed by the Pharmacopoeia, all of the pills passed the weight variation test.

| Formulation <br> Code | Friability (\%) | Hardness <br> (kg/cm2 ) | Weight Variation(mg) <br> (n=20) |
| :---: | :---: | :---: | :---: |
| F1 | 0.88 | $6.42 \pm 0.0421$ | $199.5 \pm 1.865$ |
| F2 | 0.83 | $6.23 \pm 0.121$ | $198.6 \pm 1.371$ |
| F3 | 0.87 | $6.29 \pm 0.121$ | $198.9 \pm 1.452$ |
| F4 | 0.77 | $5.99 \pm 0.111$ | $199 \pm 2.258$ |
| F5 | 0.88 | $5.85 \pm 0.113$ | $198.9 \pm 1.492$ |
| F6 | 0.68 | $5.54 \pm 0.119$ | $198.7 \pm 1.531$ |
| F7 | 0.87 | $5.35 \pm 0.046$ | $198.9 \pm 1.786$ |

| F8 | 0.92 | $5.23 \pm 0.075$ | $199.3 \pm 1.942$ |
| :---: | :---: | :---: | :---: |
| F9 | 0.88 | $6.29 \pm 0.121$ | $198.9 \pm 1.452$ |

Table no 3: Post compressional parameters of gastro retentive mucoadhesive tablet of Nicardipine

### 4.4.5 Thickness

The micrometre ( mm ) unit of measurement for tablet thickness was used. The tablet's thickness suggests that the die fill was consistent. Punches are 8 mm in diameter, and each pill weighs 200 mg , therefore these factors together determine the thickness. Each formulation's average weight was noted and is displayed in Table 8.8. Thickness values range from 2.8390 .026 to 3.1290 .043 mm .

### 4.4.6 Uniformity of drug content:

All of the developed pills' drug contents were found to be within the permitted range. Nicardipine's drug content percentage ranged from 94.89 to 99.24 percent.The findings within the range show that the mixing was uniform. The table displays the percentage of drugs in each formulation.

Tableno 4: Post compressional parameters of gastro retentive mucoadhesive tablet of Nicardipine

| Formulation Code | Thickness (mm) (n=3) <br> Mean $\pm$ S.D | Drug Content (\%) (n=3) <br> Mean $\pm$ S.D |
| :---: | :---: | :---: |
| F1 | $2.969 \pm 0.038$ | $98.98 \pm 1.154$ |
| F2 | $2.839 \pm 0.026$ | $96.27 \pm 0.891$ |
| F3 | $2.929 \pm 0.021$ | $98.59 \pm 0.672$ |
| F4 | $3.049 \pm 0.039$ | $98.40 \pm 0.866$ |
| F5 | $2.969 \pm 0.054$ | $98.59 \pm 0.865$ |
| F6 | $3.129 \pm 0.043$ | $96.82 \pm 0.861$ |
| F7 | $2.919 \pm 0.021$ | $98.43 \pm 0.869$ |
| F8 | $2.959 \pm 0.047$ | $99.24 \pm 0.586$ |
| F9 | $3.047 \pm 0.040$ | $97.90 \pm 0.856$ |

### 4.4.7 Swelling study

Swelling index testing was done for the initial formulation, and the results are displayed in the table. The findings of the evaluation of the swelling index of the tablets from each formulation (F1 to F9) are shown in Table 5.

Table no 5 \% swelling index for polymer gastro retentive mucoadhesive tablet of Nicardipine

### 4.4.8 In vitrodissolution

Utilising the USP XXIII dissolution test apparatus-II at 50 rpm and 900 mL of 6.8 pH buffer kept at 370.5 oC as the dissolve medium, in vitro drug release tests were carried out. Preliminary formulations' in vitro drug release profiles were compiled in Table No. 1 of in vitro dissolution investigations of polymer formulations. Figure shows the cumulative percentage medication release plotted against time (Hr) for early formulations.

Table no 6: \% Cumulative drug release of polymer gastro retentive mucoadhesive tablet of Nicardipine (F1-F5)

| Time <br> $(\mathbf{H r s})$ | F1 | F2 | F3 | F4 | F5 |
| :--- | :--- | :--- | :--- | :--- | :--- |

### 4.4.9 In vitro mucoadhesivestrength:

Utilising a modified version of a USP dissolving test device, in vitro mucoadhesive strength tests were conducted. Table no. 8.13 displays the results for in vitro mucoadhesive strength and adhesion force. The mucoadhesive strength of F8 was much higher than that of other formulations, but it is significantly weaker than that of F9, which is the industry standard.

Table no: 8: Mucoadhesive strength of polymer gastro retentive mucoadhesive tablet of Nicardipine

| Formulation No. | Mucoadhesive strength (g) | Mucoadhesion force (N) |
| :---: | :---: | :---: |
| F1 | 23.471 | 2.302036 |
| F2 | 22.300 | 2.187184 |
| F3 | 22.720 | 2.228378 |
| F4 | 21.350 | 2.094008 |
| F5 | 20.580 | 2.018486 |
| F6 | 23.890 | 2.343131 |
| F7 | 24.576 | 2.354254 |
| F8 | 25.240 | 2.419634 |
| F9 | 21.280 | 2.094008 |

### 4.4.10 Stabilitystudy:

The accelerated stability studies were carried out according to ICH guidelines. Optimized formulations F8 were packed in amber color bottle and aluminum foil laminated on the upper part of the bottle and these packed formulations were stored in ICH certified stability chambers. Maintained at $40^{\circ} \mathrm{C} \pm 2^{0} \mathrm{C}$ (zone III conditions as per ICH Guidelines) for 3 months. The tablets were evaluated before and after one month for change in appearance, the drug content and in vitro release.

After a period of one month, the samples were observed for any change on appearance. It was observed that tablet was devoid of any change in color or appearance of any kind of spot on it. It was also noted that tablet was free of any kind of microbial or fungal growth or bad odor. The formulation batch showed circular shape with no cracks. The drug content of the formulation F8 was found to be $98.83 \%, 98.19 \%$ and $99.92 \%$ at interval of 30 days respectively. The $\%$ CDR of formulation F 8 was found to be $94.16 \%, 93.98 \%$ and $93.82 \%$ at interval of 30 days respectively.

Table no 8.14: Stability study for F8

| Time (days) | Physical <br> Appearance | Drug content | \% CDR |
| :--- | :--- | :--- | :--- |
| 30 | No change | $98.83 \%$ | 94.16 |
| 60 | No change | $98.19 \%$ | 93.98 |
| 90 | No change | $99.92 \%$ | 93.82 |

Study of different evaluation parameters of optimized batch (F8) after stability study:

| Sr. No. | Parameters | $\mathbf{4 0} \mathbf{}{ }^{\mathbf{C}} \mathbf{~ 7 5 \%}$ RH |
| :--- | :--- | :--- |
| 1 | Friability | $0.24 \%$ |
| 2 | Hardness | $3.3 \mathrm{Kg} / \mathrm{cm}^{2}$ |
| 3 | In-vitro release | $99.95 \%$ |

| 4 | Swelling Index | $90.51 \%$ |
| :--- | :--- | :--- |
| 5 | Mucoadhesive Strength | 20.796 |

## CONCLUSION:

The goal of the current study was to develop a mucoadhesive drug delivery system for the oral anti-diabetic medication nicordinpine in order to increase its oral bioavailability and provide sustained drug release for a longer period of time. According to the experimental findings, Nicardipine mucoadhesive drug delivery systems can be made utilising the direct compression approach and a variety of polymers, including Chitosan, Gurgum, Tragacanth, and HPMC gum. A suitable technique for drug analysis using UV spectrophotometry was created. In phosphate buffer at pH 6.8 , nicotripine exhibited maximum absorption at a wavelength of 235 nm . Since the regression coefficient (r2) was found to be 0.999 , it was clear that concentration and absorbance had a linear relationship. Studies using IR spectroscopy revealed that there isin the developed formulations, there was no drug-polymer interaction. Final formulations were created utilising mixtures of two or three polymers based on developed preliminary formulations. It was discovered that none of the manufactured tablet formulations had capping or chipping. This study came to the conclusion that when gum content increases, so does the swelling index. Compared to other polymers, guar gum was found to cause higher edoema. Gaur gum is swollen more than tragacanth gum or chitosan, in that order. The majority of the Nicardipine Mucoadhesive Drug Delivery System formulations showed zero order release kinetics, and the drug release is governed by a non-Fickanian diffusion mechanism. This study came to the conclusion that the in vitro mucoadhesive strength increases as gum concentration increases. Chitosan demonstrated increased mucoadhesivestrength. Gaur gum is the strongest mucoadhesive, followed by tragacanth gum and chitosan. Studies on the short-term stability of optimised formulations F7 indicates that after one month of storage at 400C 20C and $75 \% \mathrm{RH} 5 \%$, there have been no appreciable changes to the drug content or dissolving parameter values.
